About Teledyne DALSA
Teledyne DALSA is an international high performance semiconductor and electronics company that designs, develops, manufactures, and markets digital imaging products and solutions, in addition to providing wafer foundry services.
Teledyne DALSA Digital Imaging offers the widest range of machine vision components in the world. From industry-leading image sensors through powerful and sophisticated cameras, frame grabbers, vision processors and software to easy-to-use vision appliances and custom vision modules.

Genie TS Series Overview

Description

The Genie TS, a member of the Genie camera family, provides a new series of affordable easy to use digital cameras specifically engineered for industrial imaging applications requiring embedded image processing and improved network integration. Genie TS provides functions to increase dynamic range to ensure optimized image capture from a range of lighting conditions. The TS series integrates features like motorized lens control, zoom and focus functionality, auto iris, image compression, image transfer-on-demand, and both RS-485 and RS-232 ports.

Genie cameras combine standard gigabit Ethernet technology (GigE Vision 2.0 Compliant) with the Teledyne DALSA Trigger-to-Image-Reliability framework to dependably capture and transfer images from the camera to the host PC. Genie TS cameras are available in a number of models implementing different sensors and image resolutions, either in monochrome or color versions.
Genie Application Advantages

- Optimized, rugged design
- GigE Vision 2.0 compliant (pending)
- Gigabit Ethernet (GigE) interconnection to a computer via standard CAT5e or CAT6 cables
- Supports connection to the host computer NIC through a GigE network switch
- Available in multiple resolutions
- High frame rates with high resolutions
- High dynamic range with support for a Multi-slope function
- Digital binning for increased sensitivity
- Auto-Brightness (Auto-exposure, Auto-gain (AGC), Auto-iris)
- Supports cycling multiple exposure times for sequential images, along with other parameters
- Multiple lookup table pre-processing for monochrome cameras, single for color versions
- Multiple real-time shading corrections available with image cycling (i.e. Flat Field processing)
- Horizontal and Vertical Flip function
- Smoothing / Sharpening image filtering
- Supports several trigger modes for image capture control including motion detection
- Supports JPG image compression with user controlled parameters
- 4 general purpose inputs with programmable threshold
- 4 general purpose outputs
- Supports auto iris and motorized zoom and focus lens control
- Native Trigger-to-Image Reliability design framework
- Visual status LEDs on camera back plate
- 1µs internal timer or external events can timestamp images
- Supported by Sapera™ LT software libraries
- Supports Power Over Ethernet and auxiliary power input
- Refer to the Operation Reference and Technical Specifications section of the manual for full details
Part Numbers and Software Requirements

This manual covers the Genie TS monochrome models summarized below. Color Genie TS models and other lens mount adapters will be added as per availability. See "Camera Specifications" on page 9 for each Genie TS model.

Genie Accessories & Cables (sold separately)

- Nikon F bayonet Adapter (see “Nikon F Bayonet to M42x1 Adapter” on page 92) G2-AM42-MOUNT4
- Genie TS I/O and Power breakout cable (25-pin Micro-D type connector) G2-IOPC-MD25F
- Optical filters such as NIR/UV blocking filters are available from Midwest Optical Systems.

Teledyne DALSA Software Platform

- Sapera LT version 7.20 or later (for Windows) includes Sapera Runtime and CamExpert Provides everything you will need to develop imaging applications
- Linux Package for Genie TS Contact Sales at Teledyne DALSA
- Sapera Processing Imaging Development Library (available for Windows or Linux - sold separately): Contact Sales at Teledyne DALSA

Third Party GigE Vision Software Platform Requirements

- Support of GenICam GevApi version 2.0 General acquisition and control
- Support of GenICam GevApi version 2.3 File access: firmware, LUT, FFC, configuration data, upload & download
- Support of GenICam XML schema version 1.1
- Support of GigE Vision 1.2 Includes Chunk Metadata support version 1.2
- support of GigE Vision 2.0 Jpeg payload type including chunk support of version 2.0
- GenICam™ support — XML camera description file Embedded within Genie
GigE Vision Sapera Application Description

Genie cameras are 100% compliant with the GigE Vision 1.2 and 2.0 specification which defines the communication interface protocol used by any GigE Vision device. The device description and capabilities are contained in an XML file. For more information see: http://www.machinevisiononline.org/public/articles/index.cfm?cat=167

Genie cameras implement a superset of the GenICam™ specification which defines device capabilities. This description takes the form of an XML device description file respecting the syntax defined by the GenApi module of the GenICam™ specification. For more information see www.genicam.org.

The Teledyne DALSA GigE Vision Module provides a license free development platform for Teledyne DALSA GigE hardware or Sapera vision applications. Additionally supported are Sapera GigE Vision applications for third party hardware with the purchase of a GigE Vision Module license, or the Sapera processing SDK with a valid license.

The GigE Vision Compliant XML device description file is embedded within Genie firmware allowing GigE Vision Compliant applications access to Genie capabilities and controls immediately after connection.

<tbody>
<tr>
<td>M42 x 1 mount</td>
<td>12 mm</td>
</tr>
<tr>
<td>Nikon F bayonet mount</td>
<td>46.5 mm (34.5 mm for the F mount adapter plus 12 mm for the camera body)</td>
</tr>
</tbody>
</table>

## Mechanical Interface

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Camera Size</td>
<td>49(H) x 49(W) x 54(L) in mm, see “Genie TS Mechanical Specifications” on page 91</td>
</tr>
<tr>
<td>Mass</td>
<td>196 g (no lens)</td>
</tr>
<tr>
<td>Power connector</td>
<td>via 25-pin Micro-D connector, or RJ45 in PoE mode</td>
</tr>
<tr>
<td>Ethernet connector</td>
<td>RJ45</td>
</tr>
</tbody>
</table>

## Electrical Interface

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input Voltage</td>
<td>+12 to +24 Volts DC (+20%/- 10%) at 0.6 Amp minimum</td>
</tr>
<tr>
<td>Power Dissipation</td>
<td>&lt; 6W</td>
</tr>
<tr>
<td>Operating Temperature</td>
<td>-20 to 60°C</td>
</tr>
<tr>
<td>Relative Humidity</td>
<td>5% to 90% non-condensing (operating)</td>
</tr>
<tr>
<td>Output Data Configuration</td>
<td>Gigabit Ethernet with PAUSE Frame support (as per IEEE 802.3x)</td>
</tr>
<tr>
<td>Data and Control</td>
<td>GigE Vision compliant at 1000 or 100 Mbps</td>
</tr>
</tbody>
</table>
Specifications for each available sensor follow this section.

Genie TS Sensor Performance

The sensor description below provides a specification table and response graphics. The graph describes the sensor response to different wavelengths of light (excluding lens and light source characteristics). Visible light spans wavelengths between about 390 - 780 nanometers. Wavelengths below 390 nm are termed ultra-violet while those above 780 nm are termed infra-red.

DALSA DCK4131 Monochrome CMOS Sensor Specifications

<table>

<td>16 DN/nJ/cm² @ 560 nm (typical)</td>
</tr>
</tbody>
</table>

† Dynamic Range Test Conditions
- Analog Gain 1x
- Exposure 1500µs
- Factory FFC Active
- Defective Pixel Detection Active with Threshold at 5%
- Averaging 10 frames

†† SNR Test Conditions
- Analog Gain 1x
- Exposure 750µs
- Factory FFC Active
- Defective Pixel Detection Active with Threshold at 5%
- Averaging 10 frames at 50% saturation
Sensor Cosmetic Specifications: Teledyne DALSA DCK4131 Monochrome

The following table lists the current cosmetic specifications for models TS-M4096, TS-M3500, and TS-M2500

<table>
<thead>
<tr>
<th>Blemish Specifications</th>
<th>Maximum Number of Defects</th>
<th>Blemish Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hot/Dead Pixel defects †††</td>
<td>Typical 0.015%</td>
<td>Any pixel that deviates by ±20% from the average of neighboring pixels at 50% saturation including pixel stuck at 0 and maximum saturated value.</td>
</tr>
<tr>
<td></td>
<td>Max 0.05%</td>
<td></td>
</tr>
<tr>
<td>Spot defects</td>
<td>none</td>
<td>Grouping of more than 8 pixel defects within a sub-area of 3x3 pixels, to a maximum spot size of 7x7 pixels.</td>
</tr>
<tr>
<td>Clusters defects</td>
<td>none</td>
<td>Grouping of more than 5 single pixel defects in a 3x3 kernel.</td>
</tr>
<tr>
<td>Column defects</td>
<td>none</td>
<td>Vertical grouping of more than 10 contiguous pixel defects along a single column.</td>
</tr>
<tr>
<td>Row defects</td>
<td>none</td>
<td>Horizontal grouping of more than 10 contiguous pixel defects along a single row.</td>
</tr>
</tbody>
</table>

Note: All of the sensor cosmetic specifications are with factory flat-field correction (FFC) active and Dynamic Defective Pixel Detection active. There are no pre-flat-field camera cosmetic specifications.

††† Test conditions
- Factory FFC Active
- Defective Pixel Detection OFF
- Nominal light = illumination at 50% of saturation
- Temperature of camera front plate is 45°C
**Spectral Responsivity: Teledyne DALSA DCK4131 Monochrome**

![Spectral Responsivity Graph](image)

**Effective Quantum Efficiency: Teledyne DALSA DCK4131 Monochrome**

The following quantum efficiency graph describes the fraction of photons at each wavelength that contribute charge to the pixel.

![Effective Spectral Quantum Efficiency Graph](image)
Connecting the Genie TS Camera

GigE Network Adapter Overview

If the computer to be used with the Genie camera does not have a Gigabit network adapter or second built in Gigabit NIC, a Gigabit Network Interface adapter card (NIC) needs to be installed. Typically under Windows, the Gigabit NIC is recognized automatically when Windows boots.

An example of a high performance NIC is the Intel PRO/1000 MT adapter. Review the NIC documentation concerning any special driver required for your specific operating system. Install the PCI bus Gigabit NIC as described by the NIC manufacturer's documentation.

PAUSE Frame Support

The Genie TS supports the Gigabit Ethernet PAUSE Frame feature as per IEEE 802.3x. PAUSE Frame is the Ethernet flow control mechanism that temporarily stops data transmission on the network. The PAUSE Frame feature can help a NIC that doesn't have enough buffering to handle full-speed reception. This requires the flow control option in the NIC property settings must be enabled.

Note that this problem is not as common with advances in computer bus speeds and memory sizes. PAUSE Frame support is typically required to manage network traffic within a switch when multiple cameras are simultaneously used.

Connect the Genie TS Camera

Connecting a Genie TS to a network system is independent to whether the Teledyne DALSA Sapera LT package or a third party GigE Vision development package is used.

- Before connecting power to the camera, test all power supplies. Power supplies must meet the requirements defined in section "Genie TS Input Signals Electrical" on page 96. Apply power to the camera.
- Connect Genie to the host computer GigE network adapter or to the Ethernet switch via a CAT5e or CAT6 Ethernet cable. Note: cable should not be less than 1 meter (3 feet) long or more than 100 meters (328 feet) long.
- Once communication with the host computer is started the automatic IP configuration sequence will assign an LLA IP address as described in section "Genie IP Configuration Sequence" on page 18, or a DHCP IP address if a DHCP server is present on your network.
- Check the diagnostic LED which will be initially red then switch to flashing blue while waiting for IP configuration. See "Camera Status LED" on page 17 for Genie LED display descriptions.
- The factory defaults for Genie is Persistent IP disabled and DHCP enabled with LLA always enabled as per the GigE Vision specification. For additional information see "Genie IP Configuration Mode Details" on page 87. See the next section "Connectors" on page 16 for an overview of the Genie interfaces.
Connectors

The Genie has three connectors:

- A single **RJ45 Ethernet** connector for control and video data transmitted to/from the host computer Gigabit NIC. The Genie TS also supports Power Over Ethernet (PoE). See "Ruggedized RJ45 Ethernet Cables" on page 105 for secure cables.

- A **Micro-D sub 25** connector for camera power (or auxiliary power), plus trigger, strobe and general I/O signals. Teledyne DALSA provides an optional breakout cable (part number G2-IOPC-MD25F). See “25-pin Micro-D type Connector Details” on page 94 for connector pinout specifications.

- A 4-pin auto-iris connector pinout compatible with common DC and video iris lens.

The following figure of the Genie back end shows connector and LED locations. See "Genie TS Mechanical Specifications" on page 91 for details on the Genie connectors and camera mounting dimensions.

![](image)

Genie – Rear View

LED Indicators

The Genie has one multicolor LED to provide a simple visible indication of camera state and the RJ45 Ethernet connector has two LEDs for network status conditions. These are described below.

**Network Status Indicators**

The Genie TS RJ45 Ethernet connector has two LEDs which display standardized information as follows:

<table>
<thead>
<tr>
<th>Ethernet Connector LEDs</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left LED (Connection indicator)</td>
<td>Amber</td>
<td>Connected to a network</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>Not Connected to a network</td>
</tr>
<tr>
<td>Right LED (Link/Activity indicator)</td>
<td>Green</td>
<td>Blinking – There is activity on the port</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>No data is currently being transferred</td>
</tr>
</tbody>
</table>
**Camera Status LED Indicator**

The camera is equipped with one LED to display the operational status of the camera. When more than one condition is active, the LED color indicates the condition with the highest priority (such as an acquisition in progress has more priority than a valid IP address assignment).

Once the Genie is connected to a network, the Status LED will turn to steady blue when the IP address is assigned. Only at this time will it be possible by the GigE Server or any application to communicate with the camera. The following table summarizes the LED states and corresponding camera status.

<table>
<thead>
<tr>
<th>LED State</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED is off</td>
<td>No power to the camera</td>
</tr>
<tr>
<td>Steady Red</td>
<td>Initial state on power up before flashing. Remains as steady Red only if there is a fatal error. Camera is not initialized **</td>
</tr>
<tr>
<td>Slow Flashing Red</td>
<td>Initialization sequence in progress ** In general there is no serious problem with the Genie hardware. Wait a few minutes for the Genie to reboot itself.</td>
</tr>
<tr>
<td>Steady Red + Flashing Blue</td>
<td>Fatal Error. If the Genie TS does not reboot itself contact Technical Support.</td>
</tr>
<tr>
<td>Slow Flashing Blue</td>
<td>Ethernet cable disconnected. The camera continuously attempts to assign itself an IP address.</td>
</tr>
<tr>
<td>Fast Flashing Blue</td>
<td>File Access Feature is transferring data such as a firmware update, FCC or LUT transfer, etc.</td>
</tr>
<tr>
<td>Steady Blue</td>
<td>IP address assigned; no application connected to the camera</td>
</tr>
<tr>
<td>Steady Green</td>
<td>Application connected</td>
</tr>
<tr>
<td>Flashing Green</td>
<td>Acquisition in progress. Flashing occurs on frame acquisition but does not exceed a rate of 100ms for faster frame rates.</td>
</tr>
</tbody>
</table>

**Note:** Even if the Genie has obtained an IP address, it might be on a different subnet than the NIC it is attached to. Therefore, if the Genie LED is blue but an application cannot see it, this indicates a network configuration problem. See the troubleshooting section in this manual.

**LED States on Power Up**

The following LED sequence occurs when the Genie is powered up connected to a network with installed Genie Framework software.
**Genie IP Configuration Sequence**

The Genie IP (Internet Protocol) Configuration sequence to assign an IP address is executed automatically on camera power-up or when connected to a network. As a GigE Vision compliant device, Genie attempts to assign an IP address as follows.

For any GigE Vision device, the IP configuration protocol sequence is:
- Persistent IP (if enabled)
- DHCP (if a DHCP server is present such as the Teledyne DALSA Smart DHCP server)
- Link-Local Address (always enabled)

The factory defaults for Genie is Persistent IP disabled and DHCP enabled with LLA always enabled as per the GigE Vision specification. For additional information see "Genie IP Configuration Mode Details" on page 87.

**Supported Network Configurations**

The Genie obtains an IP address using the Link Local Address (LLA) or DHCP, by default. A LLA IP address is obtained in about 6 seconds with Microsoft Vista/7 or in about 1 minute with Microsoft XP. If required, a persistent IP address can be assigned (see "Running the Network Configuration Tool" on page 22).

Preferably, a DHCP server is present on the network, where the Genie issues a DHCP request for an IP address. The DHCP server then provides the Genie an IP address. The Teledyne DALSA Network Configuration tool, installed with the Teledyne DALSA Network Imaging Package, provides a DHCP server which is easily enabled on the NIC used with the Genie TS (refer to the Teledyne DALSA Network Imaging Package user's manual).

The LLA method, if used, automatically assigns the Genie with a randomly chosen address on the 169.254.xxx.xxx subnet. After an address is chosen, the link-local process sends an ARP query with that IP onto the network to see if it is already in use. If there is no response, the IP is assigned to the device, otherwise another IP is selected, and the ARP is repeated. Note that LLA is unable to forward packets across routers.

**Preventing Operational Faults due to ESD**

Genie camera installations which do not protect against ESD (electrostatic discharge) may exhibit operational faults. Problems such as random packet loss, random camera resets, and random loss of Ethernet connections, may all be solved by proper ESD management.

The Genie camera when used with a simple power supply and Ethernet cable, is not properly connected to earth ground and therefore is susceptible to ESD caused problems. An Ethernet cable has no ground connection and a power supply's 0 volt return line is not necessarily connected to earth ground.

Teledyne DALSA has performed ESD testing on Genie cameras using an 8 kilovolt ESD generator without any indication of operational faults. The two following methods, either individually or together will prevent ESD problems.

- **Method 1**: Use a shielded power supply and/or Ethernet cable where the shield is connected to earth ground at the supply end and to the Genie end. The Genie case is now properly connected to earth ground and can withstand ESD of 8 kilovolts, as tested by Teledyne DALSA.
- **Method 2**: Mount the Genie camera on a metallic platform which has a good connection to earth ground.
Using Genie TS with Sapera API

A Genie camera installation with Teledyne DALSA Sapera API generally follows the sequence described below. Detailed installation instructions follow this overview.

Network and Computer Overview

- Genie needs to connect to a computer with a **GigE network adapter**, either built in on the computer motherboard or installed as a third party PCI adapter. See the previous section Connecting the Genie TS Camera.

- **Laptop computers** with built in **GigE network adapters** may still not be able to stream full frame rates from Genie, especially when on battery power. Thorough testing is required with any laptop computer to determine the maximum frame rate possible (refer to the Teledyne DALSA Network Imaging Package user's manual).

- Genie also can connect through a **Gigabit Ethernet switch**. When using VLAN groups, the Genie and controlling computer must be in the same group (refer to the Teledyne DALSA Network Imaging Package user's manual).

- If Genie is to be used in a **Sapera development environment**, Sapera LT needs to be installed, either before or after the Genie software package. If Genie will be used in a GigE Vision Compliant environment, Sapera or Sapera runtime is not required and you need to follow the installation instructions of the third party package.

- Install the **Genie Framework software package** if not using a third party GigE Vision compliant package. Also install **Sapera Run-time with CamExpert** to control the Genie.

- The **Windows Firewall** exceptions feature is automatically configured to allow the Sapera GigE Server to pass through the firewall.

- Computers with **VPN software** (virtual private network) may need to have the VPN driver disabled in the NIC properties. This would be required only on the NIC used with the Genie. Testing by the user is required.

- Once a Genie is connected, look at the small camera icon added to the Windows tray (next to the clock). Ensure the Genie camera has been found (right click the icon and select Status) Note that in Windows 7, the icon remains hidden until a camera is connected.

- A new Genie installation may require a firmware update. The **File Selector** feature is used to select a firmware file. See the CamExpert procedure "File Access via the CamExpert Tool" on page 85 for additional information.

- Use CamExpert (installed either with Sapera or Sapera runtime) to test the installation of the Genie camera. Set the Genie to internal test pattern. See "Internal Test Image Generator" on page 68.

- Set up the other components of the imaging system such as light sources, camera mounts, optics, encoders, trigger sources, etc. Test with CamExpert.
Sapera LT Library Windows Installation

Note: to install Sapera LT and the Genie device driver, logon to the workstation as an administrator or with an account that has administrator privileges.

When Sapera application development is performed on the same computer that the Genie is connected to, the Sapera Development Library (version 7.20 or later) must be installed. Else, Sapera LT SDK is not required to control the Genie camera.

- Download the Teledyne DALSA Sapera package or insert the Teledyne DALSA Sapera CD-ROM. Run the executable file to start the installation.
- The installation program will prompt you to reboot the computer.
- Continue with the Genie TS Framework Installation described next.

Refer to Sapera LT User’s Manual concerning application development with Sapera.

Genie TS Framework Installation

The Genie TS Framework software package and Sapera runtime provides all components required to control the Genie with the supplied CamExpert tool. The Genie TS Framework includes the Network Imaging package (refer to the Teledyne DALSA Network Imaging package manual).

Do not install the Network Imaging package if a third-party GigE Vision network driver is used and the user does not need CamExpert.

Note: The Teledyne DALSA Sapera CamExpert tool (used throughout this manual to describe Genie TS GigE Vision features) is installed with either the Sapera LT runtime or the Sapera LT development package. If Sapera application development is required, install Sapera (7.20 or later) as described in the previous section.

Procedure

- Download the Genie TS Framework package and install the Genie Framework Software which includes the Network Imaging driver, and the Sapera GigE server.
- The procedure will prompt for acceptance of the installation folder for the Genie files.
- Optional: If the Teledyne DALSA Sapera LT SDK package is not used, click to install Sapera LT run-time only which includes CamExpert. Follow the on screen prompts and reboot when the installation is complete.

Camera Firmware Updates

A Genie TS Framework installation includes the latest camera firmware file. The default folder and an example firmware file is shown below. The user can upload new firmware using the File Access Control features as shown by CamExpert.

`\Teledyne DALSA\Genie TS\Firmwares\GenieTS_Mono-5M_8M_12M_STD-Firmware_3CA10.21.cbf`
Application Development Header Files

Teledyne DALSA provides header files for developers managing Genie TS LUT data and chunk payload data as supported by GigE Vision 1.2. These files are installed by default in the folder \drv\Program Files\Teledyne DALSA\Genie TS\Developer Support Files\.

These files are:
- **dalsa_genie_lut.h**: Defines the structure for a user LUT data file.
- **dalsa_genie_chunk_payload.h**: Used to capture the raw fields of the extended chunk metadata from the stream.
- **dalsa_genie_chunk_extract.h**: This is passed the raw chunk data and fills in a data structure allowing access to the metadata parameters.

GigE Server Verification

After a successful Genie TS Framework package installation, the GigE Server icon is visible in the desktop taskbar tray area (note that in Windows 7 the icon remains hidden until a camera is connected). After connecting a camera (see following section), allow a few seconds for the GigE Server status to update. The Genie camera must be on the same subnet as the NIC to be recognized by the GigE Server.

<table>
<thead>
<tr>
<th>GigE Server Tray Icon:</th>
<th>Device Available</th>
<th>Device IP Error</th>
<th>Device Not Available</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The normal GigE server tray icon when the Genie device is found. It will take a few seconds for the GigE Server to refresh its state after the Genie has obtained an IP address.</td>
<td>The GigE server tray icon shows a warning when a device is connected but there is some type of IP error.</td>
<td>A red X will remain over the GigE server tray icon when the Genie device is not found. This indicates a major network issue. <em>Or in the simplest case</em>, the Genie is not connected.</td>
</tr>
</tbody>
</table>

If you place your mouse cursor on this icon, the GigE Server will display the number of GigE Vision devices found by your PC. Right click the icon and select status to view information about those devices. See "Running the Network Configuration Tool" on page 22 and "Troubleshooting" on page 107 for more information.

GigE Server Status

Once the Genie is assigned an IP address (its Status LED is steady blue) the GigE server tray icon will not have a red X through it, indicating that the Genie device was found. It might take a few seconds for the GigE Server to refresh its state after the Genie has obtained an IP address.

Right-click the GigE Server tray icon to open the following menu:

| About Sapera GigE Server |
| SHOW Status Dialog Box |
| HIDE Status Dialog Box |
| Scan Network. |
Click on Show Status to open a window listing all devices connected to the host system. Each GigE device is listed by name along with important information such as the assigned IP address and device MAC address. The screen shot below shows a connected Genie with no networking problems.

![GigE Vision Device Status](image)

In the event that the device is physically connected, but the Sapera GigE Server icon is indicating that the connected device is not recognized, click Scan Network to restart the discovery process. Note that the GigE server periodically scans the network automatically to refresh its state. See "Troubleshooting" on page 107 for network problems.

---

**Optimizing the Network Adapter used with Genie**

Most Gigabit network interface controllers (NIC) allow user modifications to parameters such as Adapter Buffers and Jumbo Frames. These should be optimized for use with the Genie during the installation. Refer to the Teledyne DALSA Network Imaging package manual for optimization information.

**Running the Network Configuration Tool**

The Network Configuration tool provides information and parameter adjustments for network adapters installed in the system and any connected GigE Vision camera without use of any Windows Control Panel application. This tool allows you to:

- Activate the Network Imaging driver use for image acquisition on any NIC or disable the imaging driver for any NIC not used with a GigE Vision camera.
- Change the Auto Discovery Interval from the default of 15 seconds.
- Verify that the GigE Server is in the Windows firewall exception list.
- Configure the NIC and camera IP settings.
- Assign a User-Defined name to a connected camera.
- Assign a Persistent IP address to a camera instead of the default DHCP/LLA assigned address.
- Easily Configure the NIC as a DHCP server for connected GigE Vision camera.

**Important:** Changes made with this tool may update Genie parameters stored in flash memory. Do not remove power from the Genie camera for a minimum 10 seconds.

Refer to the Teledyne DALSA Network Imaging Module manual for more detailed information on using this tool. As shown below, the Network Configuration tool can quickly verify and modify the network configuration of the imaging system.
Run the tool from the Windows Start menu: Start•Programs•Teledyne DALSA Sapera Network Imaging Package•Dalsa Network Configuration Tool. Verify the camera appears as a child of the NIC card it is connected to. By default the Genie camera is identified by its serial number if no user-defined name has been assigned.

---

**Quick Test with CamExpert**

When the Genie TS camera is connected to a Gigabit network adapter on a host computer, testing the installation with CamExpert is a straightforward procedure.

- Start Sapera CamExpert by double clicking the desktop icon created during the Genie software installation.
- CamExpert will search for installed Sapera devices. In the Device list area on the left side, the connected Genie camera is shown or will be listed in a few seconds after CamExpert completes the automatic device search (device discovery).
- Select the Genie camera device by clicking on the camera user-defined name. By default the Genie camera is identified by its serial number. The Genie status LED will turn green, indicating the CamExpert application is now connected.
- Click on the Grab button for live acquisition (the Genie default is Free Running mode). Focus and adjust the lens iris. See "Operational Reference" on page 27 for information on CamExpert parameters with the Genie camera.
- If the Genie has no lens, just select one of the internal test patterns available. All but one are static images to use with the Snap or Grab function of CamExpert. The single “moving” test image is a shifting diagonal ramp pattern, which is useful for testing network/computer bandwidth issues. The CamExpert feature selection and the grabbed pattern are shown below.
- Refer to the Teledyne DALSA Network Imaging package manual if error messages are shown in the Output Messages pane. But first, increase the value of the Genie Interpacket Delay feature available from the GigE Vision Transport Layer Category group in CamExpert. An increase from default may correct errors with NIC interfaces that do not have adequate performance.
About the User-Defined Camera Name

The Genie can be programmed with a user-defined name to aid identifying multiple cameras connected to the network. For instance, on an inspection system with 4 cameras, the first camera might be labeled “top view”, the second “left view”, the third “right view” and the last one “bottom view”. The factory default user name is set to match the camera serial number for quick initial identification. Note that the factory programmed Genie TS serial number and MAC address are not user changeable.

When using CamExpert, multiple Genie TS cameras on the network are seen as different "Genie_TS-xxxxx" devices as an example. Non Teledyne DALSA cameras are labeled as “GigEVision Device”. Click on a device user name to select it for control by CamExpert.

An imaging application uses any one of these attributes to identify a camera: its IP address, MAC address, serial number or User Name. Some important considerations are listed below.

- Do not use the camera's IP address as identification (unless it is a persistent IP) since it can change with each power cycle.
- A MAC address is unique to a single camera, therefore the control application is limited to the vision system with that unique camera if it uses the camera's MAC address.
- The User Name can be freely programmed to clearly represent the camera usage. This scheme is recommended for an application to identify cameras. In this case, the vision system can be duplicated any number of times with cameras identified by their function, not their serial numbers or MAC address.
Silent Installation of Genie Framework

The Genie TS Framework installation can be integrated within a developer's installation procedure. The silent installation mode allows the Genie Framework installation to proceed without the need for mouse clicks from a user.

Two steps are required:

- Preparation of a response file to emulate a user.
- Invoking the Genie Framework installer with command options to use the prepared response file.

Creating the Response File

An installer response file is created by performing a Genie Framework installation with the command line switch "-r". The response file is automatically named setup.iss which is saved in the \windows folder. One simple method is to execute the Framework installer from within a batch file. The batch file will have one command line.

As an example, using the possible executable file name for the Framework, the command line is:

"Genie_TS_1.00.00.0000 Release.exe" –r

Important: The executable name is enclosed in quotation marks. This is required because of the space characters in the Genie Framework file name.

Running a Silent Mode Installation

A Genie Framework silent installation, whether done alone or within a larger software installation requires the Genie Framework executable and the generated response file setup.iss.

Execute the Framework installer with the following command line:

"Genie_TS_1.00.00.0000 Release.exe" -s -f1".\setup.iss"

where in this example, the switch –f1".\setup.iss" specifies that the setup.iss file is in the same folder as the Framework installer.
Windows Embedded 7 Installation

Windows Embedded 7 is not officially supported by Teledyne DALSA due to the number of possible configurations. However, Sapera LT and other Teledyne DALSA products should function properly on the Windows Embedded 7 platform provided that the required components are installed.

Teledyne DALSA provides answer files (.xml) for use during Windows Embedded 7 installation that install all necessary components for running Sapera LT 32-bit or 64-bit versions (SDK or Runtime), Sapera Processing 32-bit or 64-bit versions (SDK or Runtime), Teledyne DALSA framegrabbers or Genie GigE Vision devices.

For each platform (32 or 64-bit), the answer file is provided:

- SaperaGenie.xml: Configuration for Sapera LT, Sapera Processing and Teledyne DALSA Genie devices

These files are located in the following directories:

- `<Install Directory>`\Sapera\Install\Win7_Embedded\Win32
- `<Install Directory>`\Sapera\Install\Win7_Embedded\Win64

The OS footprint for these configurations is less than 1 GB. Alternatively, the Windows Thin Client configuration template provided by Microsoft in the Windows Embedded 7 installation also provides the necessary dependencies for Sapera LT, Teledyne DALSA framegrabbers and Genie devices (with an OS footprint of approximately 1.5 GB).

If you are installing other applications on the Windows Embedded 7 platform, it is recommended that you verify which components are required, and if necessary, create a corresponding Answer File.

For more information on performing dependency analysis to enable your application on Windows Embedded 7, refer to the Microsoft Windows Embedded 7 documentation.
Using CamExpert with Genie TS Cameras

The Sapera CamExpert tool is the interfacing tool for GigE Vision cameras, and is supported by the Sapera library and hardware. When used with a Genie TS camera, CamExpert allows a user to test most of the operating modes. Additionally CamExpert saves the Genie user settings configuration to the camera or saves multiple configurations as individual camera parameter files on the host system (*.ccf).

An important component of CamExpert is its live acquisition display window which allows immediate verification of timing or control parameters without the need to run a separate acquisition program.

Click on any parameter and a short description is displayed below the Category pane. The same context sensitive help is available by clicking on the button then click on a camera configuration parameter. Click on the button to open the help file for more descriptive information on CamExpert.

CamExpert Panes

The various areas of the CamExpert tool are described in the summary figure below. GigE Vision device Categories and Parameter features are displayed as per the device’s XML description file. The number of parameters shown is dependent on the View mode selected (Beginner, Expert, Guru – see description below).
- **Device pane**: View and select from any installed GigE Vision or Sapera acquisition device. After a device is selected CamExpert will only present parameters applicable to that device.

- **Parameters pane**: Allows viewing or changing all acquisition parameters supported by the acquisition device. CamExpert displays parameters only if those parameters are supported by the installed device. This avoids confusion by eliminating parameter choices when they do not apply to the hardware in use.

- **Display pane**: Provides a live or single frame acquisition display. Frame buffer parameters are shown in an information bar above the image window.

- **Control Buttons**: The Display pane includes CamExpert control buttons. These are:
Acquisition control button:
Click once to start live grab, click again to stop.

Single frame grab:
Click to acquire one frame from device.

Software trigger button:
With the I/O control parameters set to Trigger Enabled / Software Trigger type, click to send a single software trigger command.

CamExpert display controls:
(these do not modify the frame buffer data)
Stretch (or shrink) image to fit, set image display to original size, or zoom the image to any size and ratio. Note that under certain combinations of image resolution, acquisition frame rate, and host computer speed, the CamExpert screen display may not update completely due to the host CPU running at near 100%. This does not affect the acquisition.

Histogram / Profile tool:
Select to view a histogram or line/column profile during live acquisition.

- **Output pane**: Displays messages from CamExpert or the GigE Vision driver.

**CamExpert View Parameters Option**

All camera features have a Visibility attribute which defines its requirement or complexity. The states vary from Beginner (features required for basic operation of the device) to Guru (optional features required only for complex operations).

CamExpert presents camera features based on their visibility attribute. CamExpert provides quick Visibility level selection via controls below each Category Parameter list [ << Less   More>> ]. The user can also choose the Visibility level from the View · Parameters Options menu.

**Camera Information Category**

Camera information can be retrieved via a controlling application. Parameters such as camera model, firmware version, etc. are read to uniquely identify the connected Genie device. These features are typically read-only. GigE Vision applications retrieve this information to identify the camera along with its characteristics.

The Camera Information Category groups information specific to the individual GigE Vision camera. In this category the number of features shown are identical whether the view is Beginner, Expert, or Guru.

Features listed in the description table but tagged as *Invisible* are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.
Camera Information Feature Descriptions

The following table describes these parameters along with their view attribute and in which device version the feature was introduced. Additionally the Device Version column will indicate which parameter is a member of the DALSA Features Naming Convention (using the tag DFNC), verses the GenICam Standard Features Naming Convention (SFNC not shown).

The Device Version number represents the camera software functional group, not a firmware revision number. As Genie TS capabilities evolve the device version tag will increase, therefore identifying the supported function package.

Sensor Control Category

The Genie TS sensor controls, as shown by CamExpert, groups sensor specific parameters. Parameters in gray are read only, either always or due to another parameter being disabled. Parameters in black are user set in CamExpert or programmable via an imaging application.

Features listed in the description table but tagged as *Invisible* are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.

Sensor Control Feature Descriptions

The following table describes these parameters along with their view attribute and minimum camera firmware version required. Additionally the firmware column will indicate which parameter is a member of the DALSA Features Naming Convention (DFNC), verses the GenICam Standard Features Naming Convention (SFNC not shown).

Gain and Black Level Control Details

The Genie TS series of cameras provide gain and black level adjustments. Dependent on the model of camera, adjustments are available at the sensor as an analog variable and/or in the digital domain. The gain and black level controls can make small compensations to the acquisition in situations where lighting varies and the lens iris cannot be easily adjusted. Optimal gain and black level adjustments maximize the Genie TS dynamic range for individual imaging situations. The user can evaluate Gain and Black Level by using CamExpert.

Features and limitations are described below.

- **Black Level** offset is expressed as a digital number providing a +/- offset from the factory setting. The factory setting optimized the black level offset for maximum dynamic range under controlled ideal dark conditions.

- **Analog Gain** is expressed as a multiplication factor applied at the sensor level, before any FFC. The increased gain increases the sensor dynamic range but with a non-proportional increase in noise.

- For each setting of analog gain, the sensor data has applied a unique Factory set Flat Field Correction, to ensure uniform pixel response, which is applied after the analog gain stage but before the digital gain stage.

- When any Flat Field Correction is applied, the resulting gain multiplying factor is increased based on the FFC calibration. As an example with Genie TS-12M with FFC Active and default Black Offset, with an analog gain set to 2.65, the resulting multiplying factor is 2.75.

- **Digital Gain** is expressed as a multiplication factor applied after the Analog Gain and any FFC stages, but note that increasing digital gain does not increase the low level resolution and increases the sensor noise proportionately.

Exposure Controls Details

Exposure Control modes define the method and timing of controlling the sensor integration period. The integration period is the amount of time the sensor is exposed to incoming light before the video frame data is transmitted to the controlling computer.

- Exposure control is defined as the start of exposure and exposure duration.

- The feature Exposure Mode selects the controlling method for the exposure.

- The start of exposure can be an internal timer signal (free-running mode), an external trigger signal, a software function call trigger.

- The exposure duration can be programmable (such as the case of an internal timer) or controlled by the external trigger pulse width.

**Free-running Programmable Exposure**

Genie TS is in a multifunctional free running mode with the following features:
• Programmable internal trigger, where the maximum and minimum sensor frame rate limits are defined by the ExposureTime feature.

• Exposure synchronization timing is "Synchronous Mode" (on page 36) where the exposure is aligned with the sensor horizontal line timing and the next acquisition is triggered by an internal programmable timer.

• Exposure duration is user programmable (exposure maximum is dependent on the frame rate). Minimum exposure is 19µs.

• Image readout is simultaneous where the grabbed image frame is readout during the next frame exposure time. This allows for fastest possible frame rates. See the timing diagram below.

Example Timing:

**Exposure Example**

<table>
<thead>
<tr>
<th>Frame Inactive</th>
<th>Exposure Delay</th>
<th>Exposure</th>
<th>ReadOut</th>
<th>Frame Inactive</th>
</tr>
</thead>
</table>

*Free-running Exposure Timing*

**External Trigger Programmable Exposure**

- Also known as “Edge Pre-select” exposure. See the timing diagram below.
- An external trigger edge initiates the exposure process.
- The user programmable delay (exposureDelay) from valid trigger edge to start of exposure is camera model specific.
- Supports "Synchronous Mode" (on page 36) timing for fastest possible frame rates. Start of exposure is aligned on the next horizontal line while the exposure duration period is in 1µs steps. Exposure and sensor readout can be concurrent.
- Supports "Reset Mode" (on page 36) timing. Exposure duration is in 1µs steps. Exposure and sensor readout must be sequential, limiting the maximum frame rate.
- Exposure duration is programmable from 19µs to 16 seconds (with 1µs steps).
- Any external trigger received before the previous exposure is complete is ignored.

Example Timing

**Programmable Synchronous Mode Exposure Timing**
Synchronization Timing

Genie TS supports two types of sensor synchronization used to align the exposure to sensor timing:

- **Synchronous Mode**: Exposure is synchronous to the line timing of the sensor. Exposure time steps are 1µs and the readout can be concurrent to the exposure for the fastest possible frame rate.
- **Reset Mode**: Timing is reset to initiate exposure of the next frame. Exposure time steps are 1µs, but readout must be sequential to exposure, reducing the maximum achievable frame rate.

**Synchronous Mode**

- Synchronous mode starts the exposure period aligned to the sensor horizontal line timing and the programmable duration steps are 1µs.
- Exposure duration is from a minimum of 19µs up to 16 sec.
- In this mode, sensor exposure and sensor readout of the previous frame's exposure occur simultaneously. This allows operating the sensor up to its maximum frame rate.
- Any trigger received before the end of the exposure is ignored.
- Since the external trigger is asynchronous with the Genie horizontal line timing, the frame exposure start is subject to 1 horizontal line jitter.

**Reset Mode**

- Exposure starts immediately after a valid trigger. There is no jitter on the start of exposure.
- Exposure time is user programmable or controlled by the trigger pulse width.
- Minimum exposure is 19µs – maximum is 16 seconds, with steps of 1µs.
- Sensor readout must complete before the next exposure can start. That is, exposure and readout are sequential. Therefore, the maximum frame rate is lower than for Synchronous mode.
- Any external trigger received before the previous exposure/read out sequence is completed, is ignored.
I/O Control Category

The Genie TS I/O controls, as shown by CamExpert, groups features used to configure external inputs and acquisition actions based on those inputs, plus camera output signals to other devices. Parameters in gray are read only, either always or due to another parameter being disabled. Parameters in black are user set in CamExpert or programmable via an imaging application.

Features listed in the description table but tagged as Invisible are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.

I/O Control Feature Descriptions

The following table describes these features along with their view attribute and minimum camera firmware version required. Additionally the firmware column will indicate which parameter is a member of the DALSA Features Naming Convention (DFNC), verses the GenICam Standard Features Naming Convention (SFNC not shown).

**Operational Reference Genie_TS_Series GigE Vision Camera**
**I/O Module Block Diagram**

**Trigger Mode Details**

Genie TS image exposures are initiated by an event. The trigger event is either the camera's programmable internal clock used in free running mode, an external input used for synchronizing exposures to external triggers, or a programmed function call message by the controlling computer. These triggering modes are described below.

- **Free running (Trigger Mode=Off)**: The Genie free-running mode has programmable internal timers for frame rate and exposure period. Frame rate minimums, maximums, and increments supported are sensor specific. Maximum frame rates are dependent on the required exposure. This always uses Synchronous mode where exposure is aligned to the sensor horizontal line timing.

- **External trigger (Trigger Mode=On)**: Exposures are controlled by an external trigger signal where the specific input line is selected by the **Trigger Source** feature. External signals are isolated by an opto-coupler input with a time programmable debounce circuit.

- **Trigger Source=Software**: An exposure trigger is sent as a control command via the Ethernet network connection. Software triggers can not be considered time accurate due to network latency and sequential command jitter. But a software trigger is more responsive than calling a single-frame acquisition since the latter must validate the acquisition parameters and modify on-board buffer allocation if the buffer size has changed since the last acquisition.

- **Trigger Source=Timer1End Event**: The Timer1 End Event is used as the internal trigger source. Refer to **Counter and Timer Controls** for information on those features.

- **Trigger Source=Counter1End Event**: The Counter1 End Event is used as the internal trigger source.

- **Trigger Line Polarity**: For line signals, a rising edge signal is suggested to minimize the time it takes for the opto-coupler to change state.
**Input Line Details**

The general purpose input line signals are connected to I/O lines 1 through 4 and have the following features for control or status indication.

- **Feature set:** LineSelector (RW), LineName (RO), linePinAssociation (RO), LineFormat (RO), LineMode (RO), lineDetectionLevel (RW), lineDebouncingPeriod (RW), LineInverter (RW), LineStatus (RO).

- **Connector:** See 25-pin Micro-D type Connector Details for connector pinout and electrical information. The cable shell and shield should electrically connect the Genie TS chassis to computer chassis for maximum EMI protection.

- **Line Transition Validation:** Each input incorporates a signal debounce circuit (following the opto-couple) to eliminate short noise transitions that could be wrongly interpreted as a valid pulse. The duration is user-programmable from 0µs to 255µs with CamExpert.

- **Line Signal Propagation:** The input propagation delay is dependent on the signal used to activate the opto-coupled input. Typical delays are 3 µs for Active Open and 5 µs for Active Close.

**Output Line Details**

The general purpose output line signals are connected to I/O lines 5 through 8 and have the following features for control or status indication.

- **Feature set:** LineInverter (RW), outputLineSource (RW), outputLinePulseDelay (RW), outputLinePulseDuration (RW), outputLineValue (RW), outputLineSoftwareCmd (RW), LineSelector (RW), LineName (RO), linePinAssociation (RO), LineFormat (RO), LineMode (RO), LineStatus (RO).

- **External outputs:** Can be used as a strobe signals to control lighting or to generate programmable pulses when specific events are generated by the camera. They can also be set to a static state (close or open) by the application.

- **Output on Events:** Each output is can be set independently to one of the available event modes defined by the ‘outputLineSource’ feature.

  - For most event modes, the trigger output signal can be set to either Active Open (that is high with the load connected to a voltage source) or Active Closed (where current is drawn through the load). The output delay can be set from 0 to 16 seconds, in increments of 1 µs. The pulse duration can be set from 0 to 16 seconds, in increments of 1 µs.

**Output Open and Output Close Modes**

Output signal lines can be set to the open or close output state using software rather than hardware events. The following figures show example external circuits.

![Examples of OPEN and CLOSED output circuits](image-url)
Counter and Timer Control Category

The Genie TS counter and timer controls, as shown by CamExpert, groups parameters used to configure acquisition counters and timers for various input lines and signal edge detection. Parameters in gray are read only, either always or due to another parameter being disabled. Parameters in black are user set in CamExpert or programmable via an imaging application.

Features listed in the description table but tagged as *Invisible* are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.

Counter and Timer Control Feature Description

The following table and block diagram, describes these parameters along with their view attribute and minimum camera firmware version required. Additionally the firmware column will indicate which parameter is a member of the DALSA Features Naming Convention (DFNC), verses the GenICam Standard Features Naming Convention (SFNC not shown).

**Counter Start Source**

- **counterStartSource**: Select the counter start source. Counter increments from 0 to the value of the counterDuration feature of the counterValue Register. If the countStartSource = countResetSource, the counter resets then starts again.

**Counter Reset Cmd**

- Off: Counter Starts on the reception of the Counter Reset Icommand.

**Acquisition Start Cmd**

- AcquisitionStart: Counter starts on the reception of the Acquisition Start event.

**Exposure Start**

- ExposureStart: Counter starts on the reception of the Exposure Start event.

**Frame Start**

- FrameStart: Counter starts on the reception of the Frame Start event.

**Valid Frame Trigger**

- ValidFrameTrigger: Counter starts on the reception of the Valid Frame Trigger.

**Counter Start Line**

- counterStartLineActivation: Selects the activation mode of the input line trigger which starts the counter. This is only applicable when the counterStartSource feature selects a physical Line.

**Counter Incremental Source**

- counterIncrementalSource: Select the event source which increments the counter. The **Event Control section** provides details and timing diagrams for the supported events.

<table>

### Counter Incremental Line Activation

**counterIncrementalLineActivation**

Selects the counter signal activation mode. The counter increments on the specified signal edge or level.

- **Rising Edge**
  - **RisingEdge**
  - Increment the counter on the rising edge of the selected I/O Line.
- **Falling Edge**
  - **FallingEdge**
  - Increment the counter on the falling edge of the selected I/O Line.
- **Any Edge**
  - **AnyEdge**
  - Increment the counter on the falling or rising edge of the selected I/O Line.

### Counter Duration

**counterDuration**

Sets the duration (or number of events) before the CounterEnd event is generated.

### Counter Reset Source

**counterResetSource**

Selects the signal source to reset the counterValue Register. The counter then waits for the next countStartSource signal or event (unless countResetSource = countStartSource, which starts immediately after reset).

<table>

</tbody>
</table>

### Counter Reset Input Line Activation

**counterResetLineActivation**

Specify the edge transition on the selected line that will reset the selected counter.

- **Rising Edge**
  - **RisingEdge**
  - Reset counter on rising edge of the selected signal.
- **Falling Edge**
  - **FallingEdge**
  - Reset counter on falling edge of the selected signal.
- **Any Edge**
  - **AnyEdge**
  - Reset counter on the falling or rising edge of the selected signal.

### Counter Value

**counterValue**

Read the current value of the selected counter. (RO)

### Counter Value At Reset

**counterValueAtReset**

Reads the value of the selected counter when it was reset by a trigger or by an explicit Counter Reset command. (RO)

### Counter Reset

**counterReset**

Resets the selected counter to zero. The counter starts immediately after the reset. To temporarily disable the counter, set the Counter Event Source feature to Off. (WO)

### Timer Selector

**timerSelector**

Selects which timer to configure.

- **Timer 1**
  - **Timer1**
  - Selected Timer 1.

### Timer Mode

**timerMode**

Select the timer mode. The selected Timer is Active or Disabled. When Disabled, the Timer can be configured.

- **Off**
  - **Off**
  - The selected Timer is Disabled.
- **Active**
  - **Active**
  - The selected Timer is Enabled.

### Timer Status

**timerStatus**

Returns the current state of the timer. (RO)

- **Timer Idle**
  - **TimerIdle**
  - The timer is idle. The CounterStartSource feature is set to off.
- **Timer Trigger Wait**
  - **TimerTriggerWait**
  - The timer is waiting for a start trigger.
- **Timer Active**
  - **TimerActive**
  - The timer is counting for the specified duration.
- **Timer Completed**
  - **TimerCompleted**
  - The timer reached the TimerDuration count.

### Timer Start Source

**timerStartSource**

Select the trigger source to start the timer. The Event Control section provides details and timing diagrams for the supported events.
**Timer Reset Cmd**

- **Off**: Starts with the reception of the TimerReset command.
- **Acquisition Start**: Start Timer on Acquisition Start event.
- **Acquisition End**: Start Timer on Acquisition End event.
- **Exposure Start**: Start Timer on Exposure Start event.
- **Exposure End**: Start Timer on Exposure End event.
- **Readout Start**: Start Timer on Readout Start event.
- **Readout End**: Start Timer on Readout End event.
- **Frame Start**: Start Timer on Frame Start event.
- **Acquisition Trigger**: Start Timer on Acquisition Trigger event.
- **Line 1 Trigger**: Start Timer on a transition of I/O Line 1 event.
- **Line 2 Trigger**: Start Timer on a transition of I/O Line 2 event.
- **Line 3 Trigger**: Start Timer on a transition of I/O Line 3 event.

**Counter and Timer Group Block Diagram**

[Counter and Timer Group Block Diagram]
**Example: Counter Start Source = OFF**

- The counter starts on the `counterReset Cmd`.
- The counter continues unless a new `counterReset Cmd` is received, which then restarts the counter at 00.
- When `Counter Reset Source= ‘Event’ or ‘CounterEnd’` the counter is reset to 00 but does not restart counting, until the next `CounterReset Cmd`.

**Example: Counter Start Source = CounterEnd (itself)**

- Counter starts when Counter Mode is set to Active.
- A `Counter Reset CMD` will reset the counter to 00 and it then continues counting.
- `counterResetSource` must be set to `CounterEnd`. When the counterValue feature reaches the counterDuration value an event is generated and the counter is reset to 00, then continues.
Example: CounterStartSource = EVENT and Signal (Edge Base)

Example: CounterStartSource = Signal (Level Base) Example 1
**Example: CounterStartSource = Line (Edge Base) Example 2**

The Genie TS Advanced Processing controls, as shown by CamExpert, groups parameters used to configure Defective Pixel Detection, Flat Field calibration and use, plus LUT mode. Parameters in gray are read only, either always or due to another parameter being disabled. Parameters in black are user set in CamExpert or programmable via an imaging application.

Features listed in the description table but tagged as *Invisible* are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.
Advanced Processing Control Feature Descriptions

The following table describes these parameters along with their view attribute and minimum camera firmware version required. Additionally the firmware column will indicate which parameter is a member of the DALSA Features Naming Convention (DFNC), verses the GenICam Standard Features Naming Convention (SFNC not shown).

### Flat Field Correction Pixel Replacement Algorithm
- **flatfieldCorrectionPixelReplacement**
  - Specifies the Flat Field Correction pixel replacement algorithm. (RO)
- **Method 1**
  - Method 1
  - When pixel replacement is enabled, the pixel is replaced with the average value of the pixel to the left and right of the pixel to be replaced (of the same color plane).
- **Method 2**
  - Method 2
  - When pixel replacement is enabled, the pixel will be replaced with the Median value of the 9 pixels within the 3x3 kernel of the same color plane.

### Flat Field Correction Type
- **Area-Based**
  - Area-Based
  - Flat field correction is based on an entire image (array).

### Flat Field Correction Algorithm
- **flatfieldCorrectionAlgorithm**
  - Specifies the Flat Field correction algorithm to use. (RO)
- **Method 1**
  - Method 1
  - The following formula is used to calculate the flat field corrected pixel:
    \[
    \text{newPixelValue}[x][y] = (\text{sensorPixelValue}[x][y] - \text{FFCOffset}[x][y]) \times \text{FFCGain}[x][y]
    \]

### Flat Field Correction Pixel X Coordinate
- **flatfieldCorrectionPixelXCoordinate**
  - Specifies the X coordinate of the flat field pixel coefficient to access.

### Flat Field Correction Pixel Y Coordinate
- **flatfieldCorrectionPixelYCoordinate**
  - Specifies the Y coordinate of the flat field pixel coefficient to access.

### Flat Field Correction GAIN
- **flatfieldCorrectionGain**
  - Sets the gain to apply to the currently selected pixel.

### Flat Field Correction Offset
- **flatfieldCorrectionOffset**
  - Sets the offset to apply to the currently selected pixel.

### Defective Pixel Detection Mode
- **defectivePixelDetectionMode**
  - Sets the mode for a Dynamic Defective Pixel Detection and replacement function.
- **Off**
  - Off
  - Defective Pixel Detection is disabled.
- **Active**
  - Active
  - Defective Pixel Detection and replacement is enabled.

### Defective Pixel Detection Algorithm
- **defectivePixelDetectionAlgorithm**
  - Defective Pixel Detection Algorithm used in the Defective Pixel Detection Function. (RO)
- **Method 1**
  - Method 1
  - Proprietary function to Teledyne DALSA.
- **Method 2**
  - Method 2
  - Proprietary function to Teledyne DALSA (applies to color Bayer Sensor).

### Defective Pixel Detection Deviation
- **defectivePixelDetectionDeviation**
  - This feature sets the maximum deviation between each pixel and neighborhood pixels before tagging that pixel as defective.

### Sharpness Mode
- **sharpnessMode**
  - Sets the enable state of the sharpness feature.

### Lookup Table (LUT) Overview

The Genie TS camera includes 4 user programmable LUT tables as components of its embedded processing features. A LUT is used for operations such as gamma adjustments, invert and threshold processes.

The LUT table is a 10-bit or 12-bit LUT (per pixel – see feature LUT Size) as illustrated in the following figure (see Processing path bits per pixel). Pixel data when read out of the sensor is passed through the LUT memory array, where the new programmed pixel value is then passed to the Genie output circuit. The LUT data table is stored along with other parameters with the user configuration function.

![Simplified Genie TS LUT Block Diagram](image)

_Simplified 10-bit LUT Block Diagram_
**Sharpness Type Overview**

When activating the feature `sharpnessMode`, the feature `sharpnessType` selects the sharpening function applied to the image. The image filter functions utilize 3x3 matrix coefficients as described below.

Flat Field Correction and Defective Pixel Detection Overview

The Flat Field correction function consists of using two coefficients per pixel which correct the gain and offset of the corresponding pixel. These corrections compensate for Photo-response Non-uniformity (PRNU) and Fix Pattern noise (FPN), unique to each camera sensor. In addition a third correction element detects defective pixels (hot, cold, blinking) and replaces them with a value based on neighborhood pixels.

**Correction Function Block Diagram**

The following simplified block diagram shows that sensor data can have FFC applied or bypass that stage. If FFC is true, then the choice of standard pixel replacement or Dynamic Defective Pixel detection is made. Else Dynamic Defective Pixel detection can be enabled without FFC, or all correction modes can be bypassed.
Flat Field Correction Algorithm Description

Flat Field Correction Algorithm–Method1 (feature: flatfieldCorrectionAlgorithm) applies the following FFC formula for correcting pixel values.

\[
\text{newPixelValue}[x][y] = (\text{sensorPixelValue}[x][y] - \text{FFCOffset}[x][y]) \times \text{FFCGain}[x][y]
\]

where:
- \([x] \& [y]\) are the Flat Field Correction Pixel coordinates. See the FlatfieldCorrectionPixelXCoordinate and FlatfieldCorrectionPixelYCoordinate features.
- newPixelValue is the pixel value after Flat Field Correction is applied.
- sensorPixelValue is the pixel value before Flat Field correction is applied.
- FFCOffset is the offset coefficient value to subtract from the sensorPixelValue.
- FFCGain is the gain coefficient value that is multiplied with the sensorPixelValue.

Information on the Sapera Flat Field Coefficients File

The Flat Field Coefficients File is a standard 10-bit TIFF file. A Sapera application (such as CamExpert) creates a new SapBuffer object of the same width as the image buffer but with twice the number of lines. This provides the room to store both offset and gain Flat Field data. The Flat Field offset data is contained in the top half of the new buffer, while the gain buffer is in the bottom half.

A Sapera application saves the new buffer using SapBuffer::Save with the "-format tiff" option, which allows saving data without loss of significant bits.

Note: If the offset data = 0xff, then that is a special flag, indicating that the pixel is replaced with an adjacent pixel, without any calculation. This is the factory calibration technique for elimination of dead or hot pixels. A pixel on the left edge (beginning of the line) would be replaced with the pixel to its right, while a pixel on the right edge (end of the line) is replaced with the pixel to its left. Any pixel within a line is replaced with the average of the its neighboring pixels (on the same line). For color sensors, the same algorithm is used except the replacement pixel is of the same color.
**Important Factors about Flat Field Processing**

| Important: | During calibration, no other Genie features should be accessed or modified. The calibration process will disable functions such as image crop or flip setting. These features need to be re-enabled by the application or user only after the flat field calibration completes. |
| Important: | Before calibration, the Genie should be powered on long enough to achieve its nominal temperature (a minimum of 30 minutes). A low ambient temperature may increase the time required for the Genie to reach a stable internal temperature. |
| Calibration via CamExpert or via a User Application: | Exposure and frame rates used during a Flat Field Calibration should be similar to the exposure settings used in the camera application. |

**Defective Pixel Replacement**

The Pixel Replacement algorithm is based on a predefined pixel map (requires FFC enabled) and/or the dynamic results of the feature defectivePixelDetectionMode. The pixel replacement is controlled by the feature flatfieldCorrectionPixelReplacementAlgorithm=Method 1 or 2.

**Defective Pixel Detection Algorithm Description**

Proprietary detection algorithm based on specified percentage difference of the local area. Once identified, the pixel is replaced by the feature flatfieldCorrectionPixelReplacementAlgorithm=Method 2.

**How to do a FFC Setup via Sapera CamExpert**

The Sapera LT CamExpert tool provides an easy GUI based method for a user to perform a Flat Field Calibration. The process first requires the user to plan acquisitions in dark and bright conditions, followed by the FFC process itself. These steps are detailed below.

**Set up Dark and Bright Acquisitions with the Histogram Tool**

Before performing calibration, verify Genie acquisition with a live grab. Also at this time make preparations to grab a flat light gray level image, required for the calibration, such as a clean evenly lighted white wall or non-glossy paper with the lens slightly out of focus. Ideally a controlled diffused light source aimed directly at the lens should be used. Note the lens iris position for a bright but not saturated image. Additionally check that the lens iris closes well and have a lens cover to grab the dark calibration image.

**Verify a Dark Acquisition**

Close the camera lens iris and cover the lens with a lens cap. Using CamExpert, click on the grab button and then the histogram button. The following figure shows a typical histogram for a Genie grabbing a very dark image.
Indicates one or more "hot" pixels

Average dark pixel value

**Important:** In this example, the **average** pixel value for the frame is close to black. Also note that most sensors will show a much higher maximum pixel value due to one or more "hot pixels". The sensor specification accounts for a small number of hot or stuck pixels (pixels that do not react to light over the full dynamic range specified for that sensor).

**Verify a Bright Acquisition**

Aim the camera at a diffused light source or evenly lit white wall with no shadows falling on it. Using CamExpert, click on the grab button and then the histogram button. Use the lens iris to adjust for a bright gray approximately around a pixel value of 200 (for 8-bit pixels). The following figure shows a typical histogram for a Genie grabbing a bright gray image.
Important: In this example, the average pixel value for the frame is bright gray. Also note that sensors may show a much higher maximum or a much lower minimum pixel value due to one or more "hot or dead pixels". The sensor specification accounts for a small number of hot, stuck, or dead pixels (pixels that do not react to light over the full dynamic range specified for that sensor).

Once the bright gray acquisition setup is done, note the camera position and lens iris position so as to be able to repeat it during the calibration procedure.

**Flat Field Correction Calibration Procedure**

The following procedure uses the CamExpert Flat Field tool. Calibration is the process of taking two reference images, one of a dark field – one of a bright field (not saturated), to generate correction data for images captured by Genie. Each sensor pixel data is modified by the correction factor generated by the calibration process, so that each pixel has an identical response to the same illumination.

- Start the Flat Field calibration tool via the CamExpert menu bar:
  Pre-processing • Flat Field Correction • Calibration.
**Flat Field Calibration Window**

The Flat Field calibration window provides a three step process to acquire two reference images and then save the flat field correction data for the Genie used. To aid in determining if the reference images are valid, a histogram tool is provided so that the user can review the images used for the correction data. Note that it is important to follow the instructions in the preceding section to prepare for the dark and light acquisition steps required for calibration.

**CamExpert Flat Field Calibration Menu**

- Click on the Advanced Setting button to change the default number of frames averaged for each calibration step. The default value is 10 frames (as performed by CamExpert).
• Setup the camera to capture a uniform dark image. Black paper with no illumination and the camera lens’ iris closed to minimum can provide such a dark image. Or cover the lens with a black lens cap.

• Click on Acquire Black Image. The flat field calibration tool will grab video frames, analyze the pixel gray level spread, and present the statistics. The desired black reference image should have pixel values less than 20. If the results are acceptable, accept the image as the black reference.

• Setup the camera to acquire a uniform white image (but not saturated white). Even illumination on white paper can be used, with a gray level of minimum of 128 (8-bit mode). It is preferable to prepare for the white level calibration step before starting the calibration procedure (see the previous section for information).

• Click on Acquire White Image. The flat field demo will grab video frames, analyze the pixel gray level spread, and present the statistics. The captured gray level for all pixels should be greater than 128 but not saturated. If the histogram shows a good grab accept the image as the white reference.

• Click on Save. The flat field correction data is saved as a TIF image with a file name of your choice (suggestions are the camera name and its serial number). The FFC data file is uploaded to the Gene TS via the file access features.

**Using Flat Field Correction**

When using CamExpert, from the menu bar enable Flat Field correction (Pre-Processing • Flat Field Correction • Hardware). Now when doing a live grab or snap, the incoming image is corrected by the current flat field calibration data for each pixel.

Use the CamExpert menu function Tools • Flat Field Correction • Load to load in a flat field correction image from previously saved calibration data. CamExpert allows saving and loading calibration data for all cameras used with the imaging system.

GigE Vision application implement features as described in the section Advanced Processing controls.
Image Format Control Category

The Genie TS Image Format controls, as shown by CamExpert, groups parameters used to configure camera pixel format, image cropping, and the binning function. Additionally a feature control to select and output a Genie TS internal test image simplifies qualifying a camera setup without a lens.

Parameters in gray are read only, either always or due to another parameter being disabled. Parameters in black are user set in CamExpert or programmable via an imaging application.

Features listed in the description table but tagged as Invisible are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.

Image Format Control Feature Description

The following table describes these parameters along with their view attribute and minimum camera firmware version required. Additionally the firmware column will indicate which parameter is a member of the DALSA Features Naming Convention (DFNC), verses the GenICam Standard Features Naming Convention (SFNC not shown).

Width Max

The maximum image width is the dimension calculated after horizontal binning, decimation or any other function changing the horizontal dimension of the image. (RO)

Height Max

The maximum image height is the dimension calculated after vertical binning, decimation or any other function changing the vertical dimension of the image. (RO)

Width and Height Features for Partial Scan Control

Width and Height controls along with their respective offsets, allow the Genie TS to grab a region of interest (ROI) within the full image frame. Besides eliminating post acquisition image cropping done by software in the host computer, a windowed ROI grab reduces the bandwidth required on the Gigabit Ethernet link since less pixels are transmitted.

Vertical Cropping (Partial Scan)

The Height and Vertical Offset features, used for vertical cropping, reduce the number of video lines grabbed for a frame. By not scanning the full vertical area of the sensor, the maximum possible acquisition frame rate is proportionately increased, up to the Genie TS model maximum.

The following figure is an example of a partial scan acquisition using both Height and Vertical Offset controls. The Vertical Offset feature defines at what line number from the sensor origin to acquire the image. The Height feature defines the...
number of lines to acquire (to a maximum of the remaining frame height). Note that only the partial scan image (ROI) is transmitted to the host computer.

![Partial Scan Illustration](image)

**Note:** In general, using short exposures at high frame rates will exceed the maximum bandwidth to host transfer speed, when the camera buffer memory is filled. The tables below (for different Genie TS models) describes frame rate maximums that cannot be sustained during continuous acquisition. Increase the exposure time, decrease the frame rate, or acquire a limited number of frames, so as to not exceed the transfer bandwidth.

**Horizontal Cropping (Partial Scan)**

Genie TS supports cropping the acquisition horizontally by grabbing less pixels on each horizontal line. Horizontal offset defines the start of the acquired video line while horizontal width defines the number of pixels per line. Horizontal control features have the following independent constants:

- Horizontal Offset is limited to pixel increment values of 2 to define the start of the video line.
- Horizontal Width decrements from maximum in pixel counts of 8 (i.e. the video width is in steps of 8 pixels).
Binning

Binning is the process where the charge on two (or more) adjacent pixels is combined. This results in increased light sensitivity since there is twice the sensor area to capture photons. The sensor spatial resolution is reduced but the improved low-light sensitivity plus lower signal-noise ratio may solve a difficult imaging situation. The user can evaluate the results of the binning function on the Genie TS by using CamExpert.

Genie TS supports horizontal and vertical binning independently, by a factor of 2 or 4 in each axis. Specifically if horizontal binning only is activated, a nominal 640x480 image is reduced to 320x480. If vertical binning only is activated, the image is reduced to 640x240. With both binning modes activated, the resulting image is 320x240.

With the Genie TS, binning is performed digitally, therefore there is no increase in acquisition frame rate. The following graphic illustrates binning.

Horizontal Binning Constraints
- Horizontal Binning of 4 is available if the image width before binning is a multiple of 32 bytes (16 pixels in Mono10)
- Horizontal Binning of 2 is available if the image width before binning is a multiple of 16 bytes (8 pixels in Mono10)
- Horizontal Binning of 1 is always available

Vertical Binning Constraints
- Vertical Binning of 4 is available if the image height before binning is a multiple of 4 lines.
- Vertical Binning of 2 is available if the image height before binning is a multiple of 2 lines.
- Vertical Binning of 1 is always available.
Internal Test Image Generator

The Genie TS camera includes a number of internal test patterns which easily confirm camera Ethernet connections or driver installations, without the need for a camera lens or proper lighting. The patterns are subject to Genie processing such as the LUT or Binning functions.

Use CamExpert to easily enable and select the any of the Genie test patterns from the drop menu while the camera is not in acquisition mode. Select live grab to see the pattern output.

The Genie test patterns are:

- **Grey Horizontal ramp**: Image is filled horizontally with an image that goes from the darkest possible value to the brightest.

- **Grey Vertical ramp**: Image is filled vertically with an image that goes from the darkest possible value to the brightest.

- **Grey Diagonal Ramp Moving**: combination of the 2 previous schemes, but first pixel in image is incremented by 1 between successive frames. This is a good pattern to indicate motion when doing a continuous grab. The static version of this pattern is **Grey Diagonal Ramp**.

- **Purity**: a purity pattern where all pixels have the same value. The gray value is incremented by one on successive frames to maximum then repeated. This also provides motion for live grabs.

- **User Defined**: Image is a User defined uploaded image for each frame.
**Metadata Control Category**

The Genie TS Metadata controls, as shown by CamExpert, groups features to enable and select inclusion of chunk data with the image payload (as specified by the specification GigE Vision 1.2).

Parameters in gray are read only, either always or due to another parameter being disabled. Parameters in black are user set in CamExpert or programmable via an imaging application.

Features listed in the description table but tagged as *Invisible* are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.

**Metadata Control Category Feature Descriptions**

The following table describes these parameters along with their view attribute and minimum camera firmware version required. Additionally the firmware column will indicate which parameter is a member of the DALSA Features Naming Convention (DFNC), verses the GenICam Standard Features Naming Convention (SFNC not shown).

Teledyne DALSA provides header files for developers managing Genie TS LUT data and chunk payload data as supported by GigE Vision 1.2. Refer to section Application Development Header Files for information about these supplied files.

**Acquisition and Transfer Control Category**

The Genie TS Acquisition and Transfer controls, as shown by CamExpert, groups parameters used to configure the acquisition mode of the device. It defines the number of frames to capture during an acquisition and the way the acquisition stops.

Parameters in gray are read only, either always or due to another parameter being disabled. Parameters in black are user set in CamExpert or programmable via an imaging application.

Features listed in the description table but tagged as *Invisible* are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.
### Acquisition and Transfer Control Feature Descriptions

### Acquisition Buffering

All acquisitions are internally buffered and transferred as fast as possible to the host system. This internal buffer allows uninterrupted acquisitions no matter any transfer delays that might occur (such as acquisition frame rates faster that the Gigabit Ethernet link or the IEEE Pause frame). Only when the internal buffer is consumed would an Image Lost Event be generated. The internal image buffer is a reserved minimum of 256MB, which is increased up to 512MB dependent on other functions not loaded or used (such as FFC).

### Start – End Command Requirements

**Important:** Every start command must have a corresponding end command. If not the camera can be in an unpredictable state. This pertains to `DeviceRegistersStreamingStart`, `DeviceRegistersStreamingEnd`, `DeviceFeaturePersistenceStart`, and `DeviceFeaturePersistenceEnd`.

### Creating a Camera Configuration File in the Host

- When using the Teledyne DALSA Sapera SDK – the CCF is created automatically via a save.
- When using a 3rd party SDK application, if that SDK supports **GenAPI 2.4**, then the process is automatic. Simply follow the 3rd party `Save Camera` method as instructed. If the SDK is based on **GenAPI 2.3** or lower, the user must call the command `DeviceFeaturePersistenceStart` before using the SDK `Save Camera` method and the command `DeviceFeaturePersistenceEnd` at the end of the save function.

### Event Control Category

The Genie TS Event control, as shown by CamExpert, groups parameters used to configure Camera Event related features. Parameters in gray are read only, either always or due to another parameter being disabled. Parameters in black are user set in CamExpert or programmable via an imaging application.

Features listed in the description table but tagged as *Invisible* are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.

**Basic Exposure Events Overview**

The following timing graphic shows the primary events related to a simple acquisition.

---

**Basic Exposure Events Overview**

The following timing graphic shows the primary events related to a simple acquisition.
**Events Associated with Triggered Synchronous Exposures**

The following timing graphic shows the primary events and acquisition timing associated with a synchronous exposure of two individually triggered frames.

![Diagram of synchronous exposures](image here)

**Events Associated with Triggered Multiple Frame Synchronous Exposures**

The following timing graphic shows the primary events and acquisition timing associated with a synchronous exposure of two frames from a single trigger event.

![Diagram of multiple frame synchronous exposures](image here)
**Events Associated with Triggered Reset Mode Exposures**

The following timing graphic shows the primary events and acquisition timing associated with reset exposure of two frames.

**GigE Vision Transport Layer Control Category**

The Genie TS GigE Vision Transport Layer control, as shown by CamExpert, groups parameters used to configure features related to GigE Vision specification and the Ethernet Connection. Parameters in gray are read only, either always or due to another parameter being disabled. Parameters in black are user set in CamExpert or programmable via an imaging application.

Features listed in the description table but tagged as *Invisible* are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.
**GigE Vision Transport Layer Feature Descriptions**

The following table describes these parameters along with their view attribute and minimum camera firmware version required. Additionally the firmware column will indicate which parameter is a member of the DALSA Features Naming Convention (DFNC), verses the GenICam Standard Features Naming Convention (SFNC not shown).

GigE Vision Host Control Category

The GigE Vision Host controls, as shown by CamExpert, groups parameters used to configure the host computer system GigE Vision features used for Genie TS networking management. None of these parameters are stored in any Genie TS camera.

These features allow optimizing the network configuration for maximum Genie bandwidth. Settings for these parameters are highly dependent on the number of cameras connected to a NIC, the data rate of each camera and the trigger modes used. Information on these features is found in the Teledyne DALSA Network Imaging Module User manual.

File Access Control Category

The File Access control in CamExpert allows the user to quickly upload various data files to the connected Genie TS. The supported data files are for Genie TS firmware updates, Flat Field coefficients. LUT data tables, and a custom image for use as an internal test pattern. Note that a Genie TS Framework installation includes a camera firmware file corresponding to the framework.

Features listed in the description table but tagged as Invisible are usually for Teledyne DALSA or third party software usage—not typically needed by end user applications.

File Access via the CamExpert Tool

- Click on the “Setting…” button to show the file selection menu.

- From the Type drop menu, select the file type that will be uploaded to the Genie TS.

- From the File Selector drop menu, select the Genie TS memory location for the uploaded data. This menu presents only the applicable data locations for the selected file type.
Click the Browse button to open a typical Windows Explorer window. Select the specific file from the system drive or from a network location. Click the Upload button to execute the file transfer to the Genie TS. Note that firmware changes require a device reset command from the Camera Information Controls.
Network Overview & Tools

Genie IP Configuration Mode Details

The following descriptions provide more information on the IP configuration modes supported by Genie. In general automatic IP configuration assignment (LLA/DHCP) is sufficient for most Genie installations.

Please refer to the Teledyne DALSA Network Imaging Package manual for information on the Teledyne DALSA Network Configuration tool and network optimization for GigE Vision cameras and devices.

Link-Local Address (LLA)

- LLA is also known as Auto-IP. It is used for unmanaged networks including direct connections from a GigE Vision device to a dedicated NIC.
- A subnet configured with LLA cannot send packets across routers but only via Ethernet switches.
- LLA is the recommended scheme when only one NIC is connected to GigE cameras. LLA is fully automatic requiring no user input.
  
  Ensure only one NIC is using LLA on your PC, otherwise IP conflicts will result.
- The NIC will automatically assign a random IP address within the 169.254.x.x subnet. The LLA protocol ensures there are no conflicts with other devices through an arbitration scheme.
- The Windows NIC configuration must be set to DHCP (the typical default case) and no DHCP server must be present on the network. Otherwise, an IP address gets assigned by the DHCP server. Windows will turn to LLA when no DHCP server answers requests coming from the NIC.
- Windows XP takes about 1 minute to obtain an LLA IP address – Windows Vista/7 will take about 6 seconds. With Windows XP, with no DHCP server involved, the network adapter icon in the system tray (in Windows XP) typically shows "limited or no connectivity". This is normal (see Microsoft KB article #892896) and indicates that the network does not have connectivity beyond routers.
- Windows and Genie are still running the DHCP process in the background. If a DHCP server becomes available on the network, the NIC will get a DHCP assigned IP address for the connected device but connections on the LLA IP address will be lost. The Teledyne DALSA Network Configuration Tool can enable the Teledyne DALSA DHCP server on the NIC used for the GigE Vision network.
- Important: If the host system has multiple NIC devices configured with LLA, then the communication stack cannot accurately resolve which NIC to forward an IP packet on the 169.254 segment. Limit the number of NIC configured using LLA to one interface. It is preferable that the Teledyne DALSA DHCP server is used instead of LLA mode (see next section).
- Use the Teledyne DALSA Network Configuration Tool to change the Genie from the default DHCP/LLA mode to Persistent IP mode when required, such as when there are multiple NIC devices with Genie connected to each. Note that Teledyne DALSA recommends DHCP/LLA as the mode of operation where a switch is used to connect multiple Genie devices.
DHCP (Dynamic Host Configuration Protocol)

- This IP configuration mode requires a DHCP server to allocate an IP address dynamically over the range of some defined subnet. The Genie camera must be configured to have DHCP enabled. This is the factory default setting.

- The DHCP server is part of a managed network. Windows itself does not provide a DHCP server function therefore a dedicated DHCP server is required. The Teledyne DALSA Network Configuration Tool can configure the Teledyne DALSA DHCP server on the NIC used for the GigE Vision network.

- The Teledyne DALSA DHCP server is recommended where there are multiple NIC ports with multiple GigE Vision devices attached. Each NIC port must use a different subnet to avoid IP address conflicts. Persistent IP assignment is required if there is no DHCP server for any additional subnet.

- Under Windows, a NIC is configured in DHCP mode by default. If no DHCP server is present on a given subnet, Windows will revert to LLA as explained in the section above.

- Ensure that a different subnet is assigned to each NIC on the network. This will automatically be managed correctly when the Teledyne DALSA DHCP server is enabled on one or all subnets used for GigE Vision devices. The graphic below illustrates a system with one NIC having the Teledyne DALSA DHCP server enabled.
Persistent IP

- This configuration is only suggested if the user fully controls the assignment of IP addresses on the network.
- The GigE Vision camera is forced a static IP address. The NIC IP address must use the same subnet otherwise the camera is not accessible.
- If the Genie camera is connected to a network with a different subnet, it cannot be accessed.
- The Teledyne DALSA Network Configuration Tool is used to set a persistent IP address. Refer to the Teledyne DALSA Network Imaging manual.
- An example of a Persistent IP address assignment on a class B network:
  - NIC Subnet = 192.168.1.1
  - Subnet Mask = 255.255.0.0
  - Persistent IP = 192.168.1.2
  - Default Gateway = 0.0.0.0
- Warning: an incorrect IP address assignment might make it impossible to connect to the camera. In such a case the Teledyne DALSA Network Configuration tool includes a function to recover a Genie camera with an unknown persistent IP and set the Genie to the factory default setting, i.e. DHCP/LLA mode. The camera MAC address must be known to use this function.
- For GigE Vision applications the FORCEIP command is used to force a new persistent IP or to change the IP configuration protocol. The Genie MAC address must be known to use the FORCEIP command.
- The following illustration shows a functional computer setup with three NIC ports, but no DHCP server. Two NIC ports are used for private GigE Vision networks. The first uses the default LLA mode for IP addresses, while the second NIC and the cameras connected to it are configured with persistent IP addresses. An application on the computer can control each Genie camera, on each subnet, without conflict.
Technical Specifications

Genie TS Mechanical Specifications

Note: Genie TS with M42x1 Lens Mount
Nikon F Bayonet to M42x1 Adapter
Genie TS Identification

| Model Part number | Serial number | MAC ID | 2D Barcode | CE and FCC logo | "Made in Canada" Statement |

Additional Notes on Genie TS Mechanical

- Genie supports a screw lock Ethernet cable (see "Ruggedized RJ45 Ethernet Cables" on page 105).
- For information on Genie lens requirements see "Optical Considerations" on page 102.
- Each camera side has two mounting holes in identical locations, which provide good grounding capabilities.
- Overall height or width tolerance is ± 0.05mm.

Sensor Alignment Specification

The following figure specifies sensor alignment for Genie TS where all specifications define the absolute maximum tolerance allowed for production cameras. Dimensions "x, y, z", are in microns and referenced to the Genie TS mechanical body or the optical focal plane (for the z-axis dimension). Theta specifies the sensor rotation relative to the sensor's center and Genie mechanical.

Sensor Alignment Specifications

\[
\begin{align*}
x & = \pm 150 \text{ microns} \\
y & = \pm 150 \text{ microns} \\
z & = \pm 300 \text{ microns (not shown)} \\
\theta & = \pm 0.2 \text{ degrees}
\end{align*}
\]

dimensions in microns (not shown to scale)
Connectors

- A single RJ45 Ethernet connector for control and video data to the host Gigabit NIC. Genie supports a screw lock Ethernet cable (see "Ruggedized RJ45 Ethernet Cables" on page 105).
- A single 4-pin Iris connector for lens control
- A single CMD-25 connector for all Genie TS I/O.

Video Iris Connector Details

- Support for industry standard motorized C-Mount lenses.
- The Genie TS Auto-iris pinout supports both the Video and DC signal modes.
- If a lens with a nonstandard Auto-iris pin out is used, the camera will:
  - Not suffer any internal component damage.
  - Continue operating without the lens.
  - Notify the user via an event message.

Genie TS Input Signals Electrical Specifications

External Inputs Block Diagram

External Input Details
- Opto-coupled (2.4V to 24V, 16mA minimum) with internal current limit.
- Selectable input trigger threshold levels for TTL, 12V, and 24V signal inputs (see `lineDetectionLevel` feature).
- Used as trigger event or integration control.
- User programmable debounce time from 0 to 255μs in 1μs steps.
- Example Signal Propagation Delays
  - Signal input at 3.3V
    - low to high - 17 μs
    - high to low - 19 μs
  - Signal input at 5V
    - low to high - 11 μs
    - high to low - 24 μs
  - Signal input at 12V
    - low to high - 10 μs
    - high to low - 12 μs
  - Signal input at 24V
    - low to high - 9 μs
    - high to low - 11 μs
Genie TS Output Signals Electrical Specifications

External Outputs Block Diagram

External Output Details
- Programmable output mode such as strobe, event notification, etc (see outputLineSource feature)
- Outputs are open on power-up from with the default factory settings. A software reset or if a user setup is configured to load on boot, will not reset the outputs to the open state.
- No output signal glitch on power-up or polarity reversal
- Maximum output voltage 26V at 10 mA

Computer Requirements for Genie Cameras

The following information is a guide to computer and networking equipment required to support the Genie camera at maximum performance. The Genie camera series complies with the current IPv4 Internet Protocol, therefore current Gigabit Ethernet (GigE) equipment should provide trouble free performance.

Host PC System
- Operating System: Windows XP, Windows Vista, Windows 7 (either 32-bit or 64-bit for all) are supported.

Network Adapters
- GigE network adapter (either add on card or on motherboard). The Intel PRO/1000 MT adapter is an example of a high performance NIC. Typically a system will need an Ethernet GigE adapter to supplement the single NIC on the motherboard.
- PCI Express adapters will outperform PCI adapters.
- Network adapters that support Jumbo Frames will outperform adapters with fixed packet size frames.

Laptop Information
- Older laptop computers with built in GigE network adapters may still not be able to stream full frame rates from Genie. Thorough testing is required with any laptop computer to determine the maximum frame rate possible (refer to the Teledyne DALSA Network Imaging Package user's manual).
Technical Specifications Genie_TS_Series GigE Vision Camera

Ethernet Switch Requirements

When there is more than one device on the same network or a camera-to-PC separation greater than 100 meters, an Ethernet switch is required. Since the Genie GigE camera complies with the Internet Protocol, it should work with all standard Ethernet switches. However, switches offer a range of functions and performance grades, so care must be taken to choose the right switch for a particular application.

IEEE 802.3x Pause Frame Flow Control

Ethernet Switches supporting Full-duplex IEEE 802.3x Pause Frame Flow Control must be used in situations where multiple cameras may be triggered simultaneously. In such a case the NIC maximum bandwidth would be exceeded if there was no mechanism to temporarily hold back data from cameras. Genie cameras support the IEEE 802.3x pause frame flow control protocol automatically so that images from many cameras can be transmitted through the switch to the NIC efficiently, without data loss. As a working example, one such switch tested at Teledyne DALSA is the NETGEAR GS716T.

| Important: The maximum frame rate possible from a large number of Genie cameras which are simultaneously triggered will depend on the Genie model, frame size, and network details. Each imaging system should be tested for frame rate limits. |

Ethernet to Fiber-Optic Interface Requirements

In cases of camera-to-PC separations of more than 100 meters but an Ethernet switch is not desired, a fiber-optic media converter can be used. The FlexPoint GX from Omnitron Systems (www.omnitron-systems.com) converts GigE to fiber transmission and vice versa. It supports multimode (MM) fiber over distances of up to 220 m (720 ft.) and single-mode (SM) fiber up to 65 km (40 mi.) with SC, MT-RJ, or LC connector types.

Important: The inclusion in this manual of GigE to fiber-optic converters does not guarantee they will meet specific application requirements or performance. The user must evaluate any supplemental Ethernet equipment.
EC & FCC Declaration of Conformity

We: Teledyne DALSA Inc.
7075 Place Robert-Joncas, Suite 142,
St. Laurent, Quebec, Canada, H4M 2Z2

Declare under sole legal responsibility that the following products conform to the protection requirements of council directive 2004/108/EC on the approximation of the laws of member states relating to electromagnetic compatibility:

Genie TS 5M, 8M and 12M

The products to which this declaration relates are in conformity with the following relevant harmonized standards, the reference numbers of which have been published in the Official Journal of the European Communities:

EN55022:2010
EN61000-4-2:2008
EN61000-4-4:2004
EN61000-4-5:2005
EN61000-4-6:2008
EN61000-4-8:2009
EN61000-4-11:2004

Further declare under our sole legal responsibility that the product listed conforms to the Code of Federal Regulations, Title 47, Part 15 (2010), subpart B, for a class A product.

Additional Reference Information

Lens Selection Overview

This section provides a general overview to selecting a lens for the various models of Genie TS. The first two lens parameters, Lens Mount and Lens Image Circle, are based on correctly matching the lens to the Genie TS model used. Brief information on other lens parameters to consider follows those sections.

Lens Mount Types

Genie TS cameras use a M42x1 screw mount and have an optional F-mount adapter. Larger sensors, such as the TS-M4096, TS-M3500, TS-M2500 models, come with the M42 mount to ensure even illumination from the lens used. Future versions of Genie TS cameras using different sensors will have CS mounts with optional C-mount adapters. The following sections describe the image size requirement for the different Genie TS mounts and sensor models.

Lens for the Genie TS with M42 or Nikon F-mount

The graphic below shows the relative sizes of the active sensor regions for Genie TS models TS-M4096 (12 megapixel), TS-M3500 (8 megapixel), and TS-M2500 (5 megapixel). These are compared to the approximate image circles of full-frame film SLR camera lenses and the lens series commonly used with popular DSLR cameras.

The Genie TS-M4096 model is subject to a drop in illumination at the sensor corners when used with common DSLR lenses. The user should compensate by enabling Flat Field Correction after performing a FFC calibration with the chosen lens.
Additional Lens Parameters (application specific)

There are other lens parameters that are chosen to meet the needs of the vision application. These parameters are independent of the Genie model (assuming that the Lens Mount and Lens Sensor Size parameters are correct, as previously covered in this section). A vision system integrator or lens specialist should be consulted when choosing lenses since there is a trade off between the best lenses and cost. An abridged list of lens parameters follows – all of which need to be matched to the application.

- **Focal Length**: Defines the focus point of light from infinity. This parameter is related to the Genie mount (C or CS mount). See Camera Specifications — Back Focal Distance.
- **Field of View**: A lens is designed to image objects at some limited distance range, at some positive or negative magnification. This defines the field of view.
- **F-Number (aperture)**: The lens aperture defines the amount of light that can pass. Lenses may have fixed or variable apertures. Additionally the lens aperture affects Depth of Field which defines the distance range which is in focus when the lens is focus at some specific distance.
- **Image Resolution and Distortion**: A general definition of image quality. A lens with poor resolution seems to never be in focus when used to image fine details.
- **Aberrations (defect, chromatic, spherical)**: Aberrations are specific types of lens faults affecting resolution and distortion. Lens surface defects or glass faults distort all light or specific colors. Aberrations are typically more visible when imaging fine details.
- **Spatial Distortions**: Describes non-linear lens distortions across the field of view. Such distortion limits the accuracy of measurements made with that lens.

Optical Considerations

This section provides an overview to illumination, light sources, filters, lens modeling, and lens magnification. Each of these components contribute to the successful design of an imaging solution.

Illumination

The amount and wavelengths of light required to capture useful images depend on the particular application. Factors include the nature, speed, and spectral characteristics of objects being imaged, exposure times, light source characteristics, environmental and acquisition system specifics, and more. The Teledyne DALSA Web site, [http://mv.dalsa.com/](http://mv.dalsa.com/), provides an introduction to this potentially complicated issue. Click on Knowledge Center and then select Application Notes and Technology Primers. Review the sections of interest.

It is often more important to consider exposure than illumination. The total amount of energy (which is related to the total number of photons reaching the sensor) is more important than the rate at which it arrives. For example, 5μJ/cm² can be achieved by exposing 5mW/cm² for 1ms just the same as exposing an intensity of 5W/cm² for 1μs.

Light Sources

Keep these guidelines in mind when selecting and setting up light source:

- LED light sources are relatively inexpensive, provide a uniform field, and longer life span compared to other light sources. However, they also require a camera with excellent sensitivity.
- Halogen light sources generally provide very little blue relative to infrared light (IR).
- Fiber-optic light distribution systems generally transmit very little blue relative to IR.
- Some light sources age such that over their life span they produce less light. This aging may not be uniform—a light source may produce progressively less light in some areas of the spectrum but not others.
Filters

Genie TS cameras are responsive to infrared (IR) wavelengths of light. To prevent infrared from distorting the acquisitions, use a “hot mirror” or IR cutoff filter that transmits visible wavelengths but does not transmit wavelengths over 750nm.

Lens Modeling

Any lens surrounded by air can be modeled for camera purposes using three primary points: the first and second principal points and the second focal point. The primary points for a lens should be available from the lens data sheet or from the lens manufacturer. Primed quantities denote characteristics of the image side of the lens. That is, \( h \) is the object height and \( h' \) is the image height.

The focal point is the point at which the image of an infinitely distant object is brought to focus. The effective focal length \( f' \) is the distance from the second principal point to the second focal point. The back focal length (BFL) is the distance from the image side of the lens surface to the second focal point. The object distance (OD) is the distance from the first principal point to the object.

Primary Points in a Lens System

![Diagram of lens system with points labeled](image)

Magnification and Resolution

The magnification of a lens is the ratio of the image size to the object size:

\[
m = \frac{h'}{h}
\]

Where \( m \) is the magnification, \( h' \) is the image height (pixel size) and \( h \) is the object height (desired object resolution size).

By similar triangles, the magnification is alternatively given by:

\[
m = \frac{f'}{OD}
\]

These equations can be combined to give their most useful form:

\[
\frac{h'}{h} = \frac{f'}{OD}
\]

This is the governing equation for many object and image plane parameters.

Example: An acquisition system has a 512 x 512 element, 10 \( \mu \)m pixel pitch area scan camera, a lens with an effective focal length of 45mm, and requires that 100\( \mu \)m in the object space correspond to each pixel in the image sensor. Using the preceding equation, the object distance must be 450mm (0.450m).
Sensor Handling Instructions

This section reviews proper procedures for handling, cleaning, or storing the Genie camera. Specifically the Genie sensor needs to be kept clean and away from static discharge to maintain design performance.

Electrostatic Discharge and the Sensor

Cameras sensors containing integrated electronics are susceptible to damage from electrostatic discharge (ESD).

Electrostatic charge introduced to the sensor window surface can induce charge buildup on the underside of the window that cannot be readily dissipated by the dry nitrogen gas in the sensor package cavity. With charge buildup, problems such as higher image lag or a highly non-uniform response may occur. The charge normally dissipates within 24 hours and the sensor returns to normal operation.

**Important**: Charge buildup will affect the camera’s flat-field correction calibration. To avoid an erroneous calibration, ensure that you perform flat-field correction only after a charge buildup has dissipated over 24 hours.

Protecting Against Dust, Oil and Scratches

The sensor window is part of the optical path and should be handled like other optical components, with extreme care.

Dust can obscure pixels, producing dark patches on the sensor response. Dust is most visible when the illumination is collimated. The dark patches shift position as the angle of illumination changes. Dust is normally not visible when the sensor is positioned at the exit port of an integrating sphere, where the illumination is diffuse.

Dust can normally be removed by blowing the window surface using a compressed air blower, unless the dust particles are being held by an electrostatic charge, in which case either an ionized air blower or wet cleaning is necessary.

Oil is usually introduced during handling. Touching the surface of the window barehanded will leave oily residues. Using rubber finger cots and rubber gloves can prevent oil contamination. However, the friction between the rubber and the window may produce electrostatic charge that may damage the sensor.

Scratches can be caused by improper handling, cleaning or storage of the camera. When handling or storing the Genie camera without a lens, always install the C-mount protective cap. Scratches diffract incident illumination. When exposed to uniform illumination, a sensor with a scratched window will normally have brighter pixels adjacent to darker pixels. The location of these pixels changes with the angle of illumination.

Cleaning the Sensor Window

Even with careful handling, the sensor window may need cleaning. The following steps describe various cleaning techniques to clean minor dust particles to accidental finger touches.

- Use compressed air to blow off loose particles. This step alone is usually sufficient to clean the sensor window. Avoid moving or shaking the compressed air container and use short bursts of air while moving the camera in the air stream. Agitating the container will cause condensation to form in the air stream. Long air bursts will chill the sensor window causing more condensation. Condensation, even when left to dry naturally, will deposit more particles on the sensor.
When compressed air cannot clean the sensor, Dalsa recommends using lint-free ESD-safe cloth wipers that do not contain particles that can scratch the window. The Anticon Gold 9”x 9” wiper made by Milliken is both ESD safe and suitable for class 100 environments. Another ESD acceptable wiper is the TX4025 from Texwipe.

An alternative to ESD-safe cloth wipers is Transplex swabs that have desirable ESD properties. There are several varieties available from Texwipe. Do not use regular cotton swabs, since these can introduce static charge to the window surface.

Wipe the window carefully and slowly when using these products.

Ruggedized RJ45 Ethernet Cables

Components Express Inc. has available an industrial RJ45 CAT6 cable that on one end has a molded shroud assembly with top/bottom thumbscrews, while the other end has a standard RJ45. This cable is recommended when Genie is installed in a high vibration environment. All Genie versions support this secure Ethernet cable.

All cables made in U.S.A. – all cables RoHS compliant.

CAT6 certified (tested for near end / far end crosstalk and return loss).

- IGE-3M (3meters)
- IGE-10M (10meters)
- IGE-25M (25meters)
- IGE-50M (50meters)
- IGE-100M (100meters)

Troubleshooting

Overview

In rare cases an installation may fail or there are problems in controlling and using the Genie camera. This section highlights issues or conditions which may cause installation problems and additionally provides information on computers and network adapters which have caused problems with Genie. Emphasis is on the user to perform diagnostics with the tools provided and methods are described to correct the problem.

The GigE Server status provides visual information on possible Genie problems. The three states are shown in the following table. Descriptions of possible conditions causing an installation or operational problem follow. Note that even a Genie installation with no networking issue may still require optimization to perform to specification.

<table>
<thead>
<tr>
<th>GigE Server Tray Icon:</th>
<th>Device Not Available</th>
<th>Device IP Error</th>
<th>Device Available</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: It will take a few seconds for the GigE Server to refresh its state after any change.</td>
<td>A red X will remain over the GigE server tray icon when the Genie device is not found. This indicates a network issue where there is no communication with Genie. <em>Or in the simplest case</em>, the Genie is not connected.</td>
<td>The GigE server tray icon shows a warning when a device is connected but there is some type of IP error.</td>
<td>The GigE server tray icon when the Genie device is found. The Genie has obtained an IP address and there are no network issues. Optimization may still be required to maximize performance.</td>
</tr>
</tbody>
</table>

Problem Type Summary

Genie problems are either installation types where the Genie is not found on the network or setup errors where the Genie device is found but not controllable. Additionally a Genie may be properly installed but network optimization is required for maximum performance. The following links jump to various topics in this troubleshooting section.

Device Not Available

A red X over the GigE server tray icon indicates that the Genie device is not found. This indicates either a major camera fault or condition such as disconnected power, or a network issue where there is no communication.

- Review the section "Using Genie TS " on page 19 to verify required installation steps.
- Refer to the Teledyne DALSA Network Imaging manual to review networking details.
- The Genie camera cannot acquire a DHCP address and/or the Windows firewall does not start after Windows XP Service Pack 2 or 3 has been installed. See "The Windows XP Firewall Service Can Not Start" on page 109.
- In multiple NIC systems where the NIC for the Genie is using LLA mode, ensure that no other NIC is in or switches to LLA mode. It is preferable that the Teledyne DALSA DHCP server is enabled on the NIC used with the Genie instead of using LLA mode, which prevents errors associated with multiple NIC ports.
Device IP Error

The GigE server tray icon shows a warning with IP errors. Review the following topics on network IP problems to identify and correct the condition.

Please refer to the Teledyne DALSA Network Imaging Package manual for information on the Teledyne DALSA Network Configuration tool and network optimization for GigE Vision cameras and devices.

Multiple Camera Issues

- When using multiple cameras with a computer with multiple NIC ports, confirm each Genie has been assigned an IP address by checking the GigE server.
- To reduce network traffic in configured problem-free systems, use the Network Configuration tool to stop camera discovery broadcasts. Refer to the Teledyne DALSA Network Imaging manual.
- When using multiple cameras connected to an VLAN Ethernet switch, confirm that all cameras are on the same subnet setup on that switch. See the Teledyne DALSA Network Imaging package manual for more information.
- If a Genie camera installed with other GigE Vision cameras cannot connect properly with the NIC or has acquisition timeout errors, there may be a conflict with the third party camera's filter driver. In some cases third party filter drivers modify the NIC properties such that the Teledyne DALSA Sapera Network Imaging Driver does not install. Verify such a case by uninstalling the third party driver and installing the Genie package again.

Device Available but with Operational Issues

A properly installed Genie with no network issues may still not perform optimally. Operational issues concerning cabling, Ethernet switches, multiple cameras, and camera exposure are discussed in the following sections:

Always Important

- Why should Genie firmware be updated? See "Firmware Updates" on page 110.
- "Power Failure During a Firmware Update—Now What?" on page 110.
- "Cabling and Communication Issues" on page 110.
- See "Preventing Operational Faults due to ESD" on page 18 to avoid random packet loss, random camera resets, and random loss of Ethernet connections.

No Timeout messages

- I can use CamExpert to grab (with no error message) but there is no image (display window stays black). See "Acquisition Error without Timeout Messages" on page 111.
- I can use CamExpert to grab (with no error message) but the frame rate is lower than expected. See "Camera acquisition is good but frame rate is lower than expected" on page 111.
- There is no image but the frame rate is lower than expected. See "Camera is functional but frame rate is lower than expected" on page 111.
- There is no image but the frame rate is as expected. See "Camera is functional, frame rate is as expected, but image is black" on page 112.

Other problems

- Unexpected 'Trigger Events'. See "Random Invalid Trigger Events" on page 112.
Verifying Network Parameters

Teledyne DALSA provides the Network Configuration tool to verify and configure network devices and the Genie network parameters. See section Network Configuration Tool of the Teledyne DALSA Network Imaging manual, if there were any problems with the automatic Genie software installation.

Before Contacting Technical Support

Carefully review the issues described in this Troubleshooting section. To aid Teledyne DALSA personnel when support is required, the following should be included with the request for support.

- From the Start menu, go to Programs • Dalsa • Sapera LT • Tools and run the Log Viewer program. From its File menu click on Save Messages to generate a log text file.
- Report the version of Genie TS Framework and Sapera version used.

Installation Issues and Functional Problems

This section covers issues that are apparent after installation or are indicated by the GigE server tray icon showing a warning symbol.

The Windows XP Firewall Service Can Not Start

After installing Windows XP Service Pack 2 or 3, the Windows Firewall service will not start. Problems with the Genie camera or Framework may include:

- The Genie camera cannot acquire a DHCP address
- Registry writes fail
- Messages in the Sapera Log Viewer include "check your firewall" and the computer firewall is disabled for no reason.

After installing Windows XP Service Pack 2 or 3, the Windows Firewall service will not start. Symptoms may include the following messages:

- When you click Windows Firewall in Control Panel, you may receive the following error message:
  Windows Firewall settings cannot be displayed because the associated service is not running. Do you want to start the Windows Firewall/Internet Connection Sharing (ICS) service?
- If you try to manually start the Windows Firewall service by using Services, you may receive the following error message:
  Could not start the Windows Firewall/Internet Connection Sharing (ICS) service on Local Computer.
  Error 0x80004015: The class is configured to run as a security id different from the caller.

These symptoms are described in detail by Microsoft support at this link (http://support.microsoft.com/kb/892199).

Without covering the details mentioned in the Microsoft support web page, the solution involves deleting two registry keys in the host computer. This procedure should only be done by someone comfortable with Windows registry backups and editing. These registry keys can be deleted via the following command console instructions:

- REG DELETE HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Security /f
- REG DELETE HKLM\SOFTWARE\Classes\AppID\{ce166e40-1e72-45b9-94e9-3b2050e8f180} /f

Reboot the computer after execution.
Device Available with Operational Issues

This section considers issues with cabling, Ethernet switches, multiple cameras, and camera exposure. All information concerning the Teledyne DALSA Network Configuration Tool and other networking considerations, is available in the Teledyne DALSA Network Imaging manual.

Firmware Updates

As a general rule any Genie installation must include the firmware update procedure (see "File Access Control Category" on page 83). Genie camera firmware that does not match a newer version of installed Genie Framework software is likely to have unpredictable behavior. Problems might be:

- Genie is not found by the device discovery process.
- Genie is found by the Sapera GigE Server but an application such as CamExpert does not see the camera.
- A Genie that had a fault with a firmware update will automatically recover by booting with the previous firmware version.

**Important**: New Genie cameras installed in previously deployed systems are fully backward compatible with the older vision application. New Genie cameras must not be programmed with older firmware.

Power Failure During a Firmware Update—Now What?

Don't panic! There is far greater chance that the host computer OS is damaged during a power failure than any permanent problems with the Genie. When electrical power returns and the host computer system has started, follow this procedure.

- Connect power to the Genie. The Genie processor knows that the firmware update failed.
- The Genie TS will boot with the previous version of firmware and will operate normally.
- Perform the firmware update procedure (see "File Access Control Category" on page 83) again.

Cabling and Communication Issues

With only two cables connected to Genie, possible cabling issues are limited.

**Power supply problems:**

- If the Genie status LED is off, the DC supply power is not connected or faulty. Verify the power supply voltage.

**Communication Problems:**

- Use a shielded cable where the connector shell electrically connects the Genie chassis to the power supply earth ground. This can eliminate trigger issues in a high EMI environment.
- Check that the Ethernet cable is clipped both to the Genie and the NIC or switch on the other end.
- Verify the Ethernet cabling. Poor cables will cause connections to auto-configure at lower speeds.
- Use a secured Ethernet cable when the Genie is in a high vibration environment. See "Ruggedized RJ45 Ethernet Cables" on page 105.
- Check the Ethernet status LEDs on the Genie RJ45 connector. The Link Status indicator is on and the activity LED should flash with network messages.
- Verify that the Ethernet cable is CAT5e or CAT6. This is very important with long cable lengths.
When using very long cables, up to the maximum specified length of 100m for gigabit Ethernet, different NIC hardware and EMI conditions can affect the quality of transmission.

Minimum recommended Ethernet cable length is 3 feet (1 meter).

Use the Log Viewer tool (see point below) to check on packet resend conditions.

Run the Sapera Log Viewer: Start•Programs•Teledyne DALSA•Sapera LT•Tools•Log Viewer. Start the Genie acquisition program, such as CamExpert. There should not be any "packet resend" messages, else this indicates a control or video transmission problem due to poor connections or extremely high EMI environments.

Acquisition Error without Timeout Messages

Streaming video problems range from total loss of image data to occasional loss of random video data packets. The following section describes conditions identified by Teledyne DALSA engineering while working with Genie in various computers and setups. See the Teledyne DALSA Network Imaging manual for information on network optimizations.

No camera exposure when expected

- Verify by using the camera in free-running mode. Do not use external trigger mode when testing a camera setup.
- If using free-running mode, verify that the exposure period is set to the maximum possible for the set frame rate.
- Load factory default from the Power-up Configuration in CamExpert. This will reset the camera to its nominal acquisition rate.

Camera is functional but frame rate is lower than expected

- Verify Ethernet link speed. If the LAN connection is limited to 100 Mbps, the Genie TS frame rate maximum will be limited once the internal buffers are filled. See the Teledyne DALSA Network Imaging manual for information on network optimizations.
- If using an external trigger, verify the trigger source rate and Genie parameters such as trigger to exposure delay.
- Verify the exposure mode type is Synchronous, not Reset mode. (See "Synchronization Timing" on page 36).

Camera acquisition is good but frame rate is lower than expected

- While running CamExpert and grabbing in free-run mode at the maximum frame rate, start the Sapera Monitor tool from the Sapera Tools installed with Sapera.
- Make sure the Memory Overflow event monitor is enabled.
- Continue grabbing from the Genie at maximum frame rate. If any memory overflow events are counted, then the Genie internal buffer could not be transmitted on time and was discarded. Such a condition may occur with large frame color or high frame rate Genie cameras.
- Verify that network parameters are optimal as described in the Teledyne DALSA Network Imaging Module manual. Ensure the host computer is not executing other network intensive tasks. Try a different Gigabit NIC.
Camera is functional, frame rate is as expected, but image is black

- Verify that the lens iris is open.
- Aim the Genie at a bright light source.
- Check that the programmed exposure duration is not too short or set it to maximum. See "Sensor Control Category" on page 32.
- Using CamExpert set the Genie to output its Internal Pattern Generator. This step is typically done for any camera installation to quickly verify the Genie and its software package. See "Internal Test Image Generator" on page 68 for information on using CamExpert to select internal patterns from Genie.

Other Problems or Issues

This section describes problems that do not fit any of the categories above. Typically these are issues found in the field under specific or unusual conditions.

Random Invalid Trigger Events

Do not change the exposure time while grabbing, else an Invalid Trigger Event may be generated. This applies to any exposure mode or trigger source. The Invalid Trigger Event is not catastrophic and only indicates the loss of a video frame. Stopping acquisitions first will avoid this error.

Minimum Sapera Version Required

Save User Configuration Failed: An unusual error that occurred with no other Genie control problem. The solution is to verify the minimum Sapera version used with the Genie Framework. The Genie TS requires Sapera version 7.20 or later.

Glossary of Terms

ARP
Address Resolution Protocol provides a way to retrieve the MAC address associated to an IP address.

Bandwidth
Describes the measure of data transfer capacity.

**CAT5e Ethernet cable**
Category 5e was designed for transmission speeds of up to 1 gigabit per second (Gigabit Ethernet).

**CAT6 Ethernet cable**
Same as Category 5e, except that it is made to a higher standard. Supports transmission speeds greater than Gigabit Ethernet with less signal attenuation over a given length of cable.

**CCD – Charge-Coupled Device**
A type of image sensor converting light into electrical charges. Has unique strengths and weaknesses compared to CMOS, giving advantages in different applications.

**CMOS - Complementary Metal Oxide Semiconductor**
A type of image sensor, different from CCD sensors, for capturing images digitally. Has unique strengths and weaknesses compared to CCD, giving advantages in different applications.

**Contiguous Memory**
A block of physical memory occupying consecutive addresses.

**DFNC**
Teledyne DALSA superset of the GenICam Standard Feature Naming Convention.

**DHCP (Dynamic Host Configuration Protocol)**
Protocol which provides a mechanism for allocating IP addresses dynamically by a DHCP server on a network. Typically dedicated DHCP servers are a component of corporate networks. Used for managed networks.

**Driver**
Also called a device driver, a program routine that links a peripheral device to the operating system. a device driver is required for its frame grabber capabilities.

**DSNU**
Dark Signal Non-Uniformity (equivalent to FPN).

**Ethernet Switch**
A network device performing bridging at full wire-speed based on MAC addresses. Packet collisions are eliminated when using a full duplex switch. An Ethernet Switch operates at Layer 2 of the seven-layer OSI model.

**FPN**
Fixed Pattern Noise (equivalent to DSNU). FPN is the peak to peak difference between the minimum and maximum measured values for all active valid pixels sensor in darkness. Fixed Pattern Noise does not include a Random Noise component.

**Frame**
One complete image data set or its equivalent storage space.
Frame buffer
An area of memory used to hold a frame of image data. A frame buffer may exist on the acquisition hardware or be allocated by the acquisition hardware device driver in host system memory.

GigE Vision specification

GenICam specification

Grab
Acquiring an image frame.

Grayscale
In image processing, the range of available brightness levels, displayed in shades of gray. In an 8-bit system, the gray scale contains values from 0 to 255. A 10-bit system has a range of 0-1023.

GVCP – GigE Vision Control Protocol
One of the core protocols of the GigE Vision specification used to control camera. GVCP uses UDP port 3956 on the camera.

GVSP – GigE Vision Stream Protocol
One of the core protocols of the GigE Vision specification used to stream images.

Host
Refers to the computer system that supports the installed frame grabber.

Hot Pixel
Pixels that do not react to light over the full dynamic range specified for that sensor.

IP – Internet Protocol
The Internet Protocol is the method by which data is sent from one computer to another on a network or across the Internet. Each device must have an IP address to identify that device on the network or on the Internet.

LLA
Link-Local Address is a protocol providing a scheme for devices to automatically assign themselves an IP address and check for IP conflict. Used in unmanaged networks.

NIC
Network Interface Card/Controller. For the Genie products the NIC must be a Gigabit Ethernet interface to provide sufficient bandwidth.

Pixel
A contraction of "picture element". The number of pixels describes the number of digital samples taken of the analog video signal. The number of pixels per video line by the number of active video lines describes the acquisition image resolution. The binary size of each pixel (e.g., 8-bits, 16-bits, 24-bits) defines the number of gray levels or colors possible for each pixel.

PRNU
Photo-Response Non-Uniformity. For a given even illumination the difference between the minimum and maximum measured pixel values is the PRNU.

Progressive Scan Camera
The progressive scan format outputs data from the camera (the signal) in sequential order as it is scanned. The scan format produces a full frame of video in a continuous stream, rather than half the image per output sequence in standard interlaced cameras.
**Random Noise**
Random noise is defined as the difference in peak to peak value for any single pixel repetitively sampled, with the sensor in darkness. For digital cameras the measurement is based on at least 512 samples from any pixel.

**Router**
A Router device forwards packets across networks. It operates at Layer 3 of the seven-layer OSI model. Note that broadcast packets (such as GigE Vision Device Discovery message) do not cross routers.

**SAT**
Saturation Output Amplitude. SAT is the average maximum output level for a specified light input.

**Scatter Gather**
Host system memory allocated for frame buffers is virtually contiguous but physically scattered throughout all available memory.

**SFNC**
GenICam Standard Feature Naming Convention. This provides the definitions of a common set of features and behaviors, which allows the creation of generic software for a whole class of cameras or devices from different vendors.

**SNR**
Signal to Noise Ratio. SNR measures the ratio between random noise and an arbitrary reference signal on the transmission path or within a device.

**Subnet**
The subnet is identified by performing the logical AND of the IP address with its subnet mask.

**TCP**
Connection-oriented transport protocol providing robustness and reliability. Used by many Internet application, such as HTML.

**Trigger**
A mechanism that initiates an action when an event occurs such as synchronizing an image acquisition to an external event. A trigger generally causes a program routine to be executed such as the resetting of camera exposure and/or the firing of a strobe light.

**UDP**
User Datagram Protocol is a connectionless transport protocol providing no guaranty of delivery or reliability. GigE Vision Control Protocol and GigE Vision Stream Protocol are based on UDP.

**Vignetting**
Caused by a lens designed for a smaller camera sensor. Vignetting describes the gradual reduction in exposure at the sensor edges. All machine vision lens specify the maximum sensor size usable before vignetting occurs.

**VLAN**
A Virtual Local Area Network is a flexible arrangement where computers connected via a VLAN Ethernet switch are not necessarily on the same LAN broadcast domain. Refer to the VLAN Ethernet switch documentation for implementation and configuration details.

**VPN**
A virtual private network is a private data network that makes use of the public telecommunication infrastructure, maintaining privacy through the use of a tunneling protocol and security procedures. The idea of the VPN is to give the company the same capabilities at much lower cost by using the shared public infrastructure rather than a private one.
