1 Camera Overview

1.1 Features

- Cmos Multi-Lines Monochrome Sensor : 4 x 4096 Pixels 5x5µm
 - 4096 RGB Pixels 5x5µm (Full Definition) in 1,2 or 4 Lines Summation
 - 2048 RGB Pixels 10x10µm (Binning) in 1 or 2 lines Summation
- Interface : NBASE-T™ (up to 5Gb/s)
- Line Rate : 140 000 l/s in 8 Bits
- Bit Depth : 8/10/12 Bits
- Scan Direction
- Flat Field Correction
- Cycling Preset Modes and Memories
- Multi ROI
- Metadata
- Rotary Encoder
- HDR Mode
- Look Up Table

1.2 Key Specifications

Characteristics	Typical Value		Unit
Sensor Characteristics at Maximum Pixel Rate			
Resolution	4096	2048	RGB Pixels
pixel size (square)	5	10	µm
Max Line Rate	140	140	kHz
Radiometric Performance at Maximum Pixel Rate and minimum camera gain			
Bit depth	8, 10 and 12		Bits
Response non linearity	< 1		%
PRNU HF Max	3		%
Dynamic range	70		dB
Peak Response (All Modes) at 650nm			
1 Line 4k 5µm	139		LSB 12bits/(nJ/cm²)
2 Lines 4k 5µm	278		LSB 12bits/(nJ/cm²)
4 Lines 4k 5µm or 1 Line 2k 10µm (Binning)	557		LSB 12bits/(nJ/cm²)
2 Lines 2k 10µm (Binning)	114		LSB 12bits/(nJ/cm²)

Test conditions :

- All values are given at Nominal Gain (0dB) : Preamp Gain x1, Amp Gain 0dB
- Figures in LSB are for a 12bits format
- Measured at exposure time = 400µs and line period = 400µs in Ext Trig Mode (Max Exposure Time)
- Maximum data rate

Functionality (Programmable via GenICam Control Interface)		
Analog Gain	Up to 12 (x4)	dB
Trigger Mode	Timed (Free run) and triggered (Ext Trig, Ext ITC) modes	
Sensor Modes	<ul style="list-style-type: none"> • 1SB or 2SB : 1 or 2 Lines of 2048 RGB Pixels of 10x10µm • 1S, 2S or 4S : 1, 2 or 4 Lines of 4096 RGB Pixels 5x5µm 	
Mechanical and Electrical Interface		
Size (w x h x l)	60 x 60 x 55	mm
Weight	247/335 without/with Heat Sinks	g
Lens Mounts	C, F, T2, M42 (embedded in the Front Face)	-
Sensor alignment	±100	µm
Sensor flatness	±50	µm
Power supply	12 - 24	V
Power dissipation	< 11	W
General Features		
Operating temperature	0 to 60 (front face) or 85 (Internal)	°C
Storage temperature	-40 to 70	°C
Regulatory	CE, FCC and RoHS compliant	

1.3 Description

To maintain their competitive advantage, industrial leaders in the machine vision market have a continuous requirement to improve defect detection accuracy and reduce the cost of imaging. The availability of the ELiiXA+ cameras with an NBASE-T™ connection offers a straightforward solution, providing:

- High throughput - enabling high resolution and colour imaging without a frame grabber at speeds of up to 5 Gigabits per second (Gbps) over Category 5e standard Ethernet cable.
- Easy integration – compatible with GigE Vision protocol.
- Long-length (100 meters+), field terminable, inexpensive cabling - reduces costs and enables easier integration in imaging systems compared with optic fibre cabling

1.4 Applications

- Raw material surface inspection
- Parcel and postal sorting
- High resolution document scanning
- Printing inspection
- Industrial Inspection

1.5 Models

Part Number	Definition	Max Speed	Details
EV71YC4MNT4005-BA0	4k x 5µm	140kHz	Delivered with a pair of Heat Sinks
EV71YC4MNT2010-BA0	2k x 10µm	140kHz	

2 Camera Performances

2.1 Camera Characterization

	Unit	4k 5µm						2k 10µm			
		Mode 1S (0dB)		Mode 2S (0dB)		Mode 4S (0dB)		Mode 1SB (0dB)		Mode 2SB (0dB)	
		Typ.	Max	Typ.	Max	Typ.	Max	Typ.	Max	Typ.	Max
Dark Noise RMS	LSB	2	3	1.9	3	2.1	4	3	4	3	4
Dynamic Range	-	2394:1	-	3412:1	-	2730:1	-	2730:1	-	2730:1	-
Readout Noise	e-	5,7	-	8	-	10	-	10	-	10	-
Full Well Capacity	e-	13650	-	27300	-	27300	-	27300	-	27300	-
SNR	dB	42.5	-	42.4	-	42.7	-	42.5	-	43	-
Peak Response	LSB/ (660nm) (nJ/cm ²)	137	-	274	-	547	-	550	-	1100	-
Non Linearity	%	0,3	-	0,3	-	0,3	-	0,3	-	0,3	-
Without Flat Field Correction :											
FPN rms	LSB	0.4	1.5	0,65	2	0,67	1.5	1.9	3	2	3
FPN pk-pk	LSB	2.6	5	4	6	4.1	6	4	6.2	4.1	6.2
PRNU hf (3/4 Sat)	%	0,15	0,5	0,14	0,5	0,13	0,5	0,15	0,5	0,15	0,5
PRNU pk-pk (3/4 Sat)	%	1.1	3	1.1	3	1	3	1.1	3	1.1	3

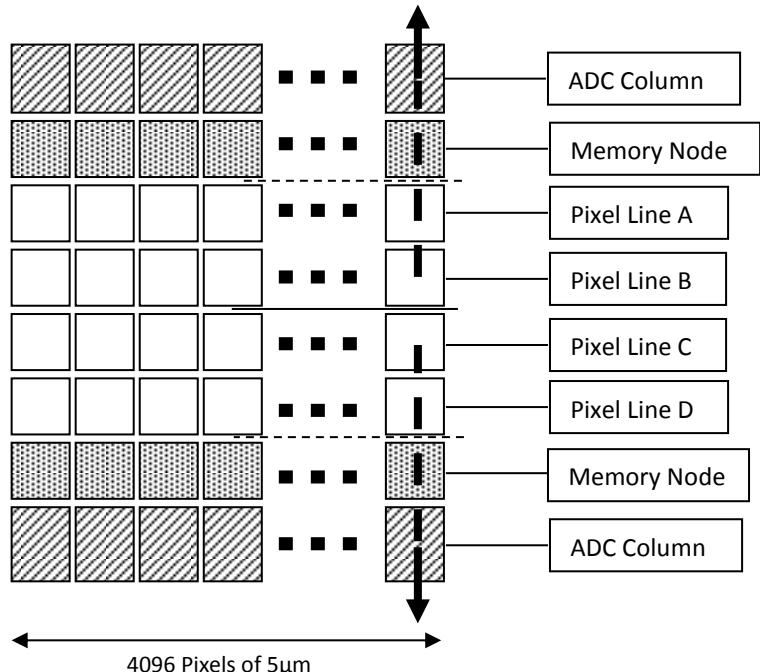

- All LSB values are in 12bits at nominal Gain

2.2 Image Sensor

The Eliixa+ 4k sensor is composed of two pairs of sensitive lines. Each pair of lines use the same Analog to Digital Column converter (ADC Column). An appropriate (embedded) Time delay in the exposure between each line allows combining two successive exposures in order to double the sensitivity of a single line.

This Time Delay Exposure is used only in the 4S multi-line modes (4 Lines) and also in the three binning modes, as described below.

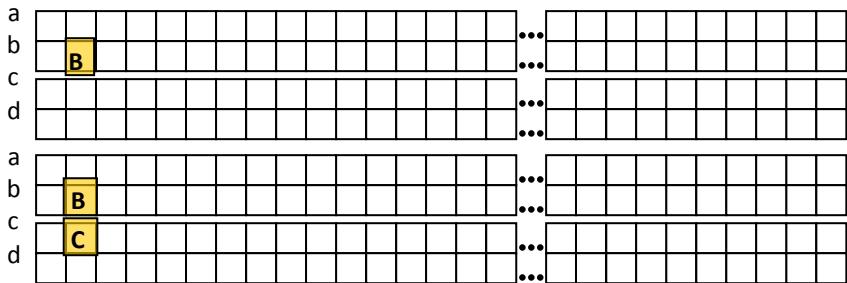

The 4096 Pixels of the whole sensor can be binned to provide 2 Lines of 2048 Pixels of 10x10µm

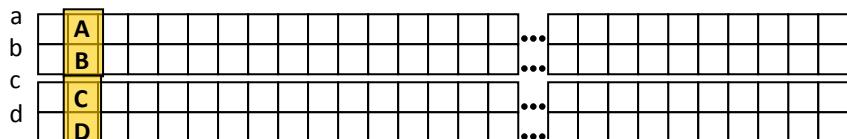

2.3 Sensor modes

4K Pixels Output

Mode 1S = B

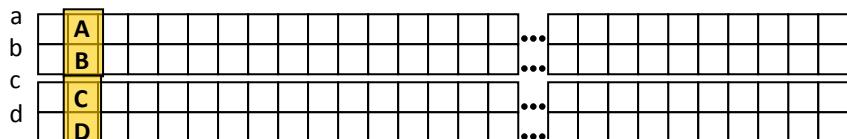

Mode 2S = B+C (FPGA)

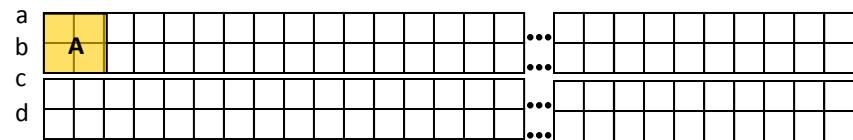

Mode 4S = (A.B)+(C.D)

Note : (A.B) = summation in the sensor

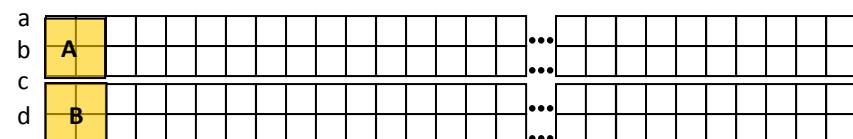

2k Pixels Output

Mode 1SB = A

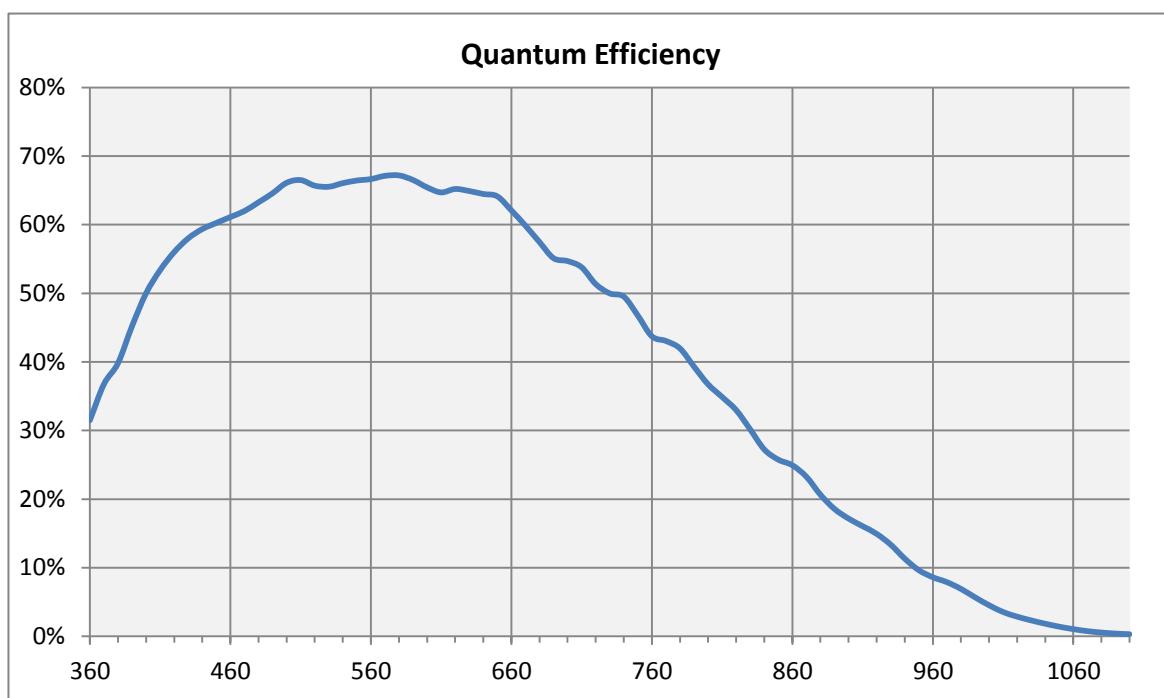

Mode 2SB = (A+B)

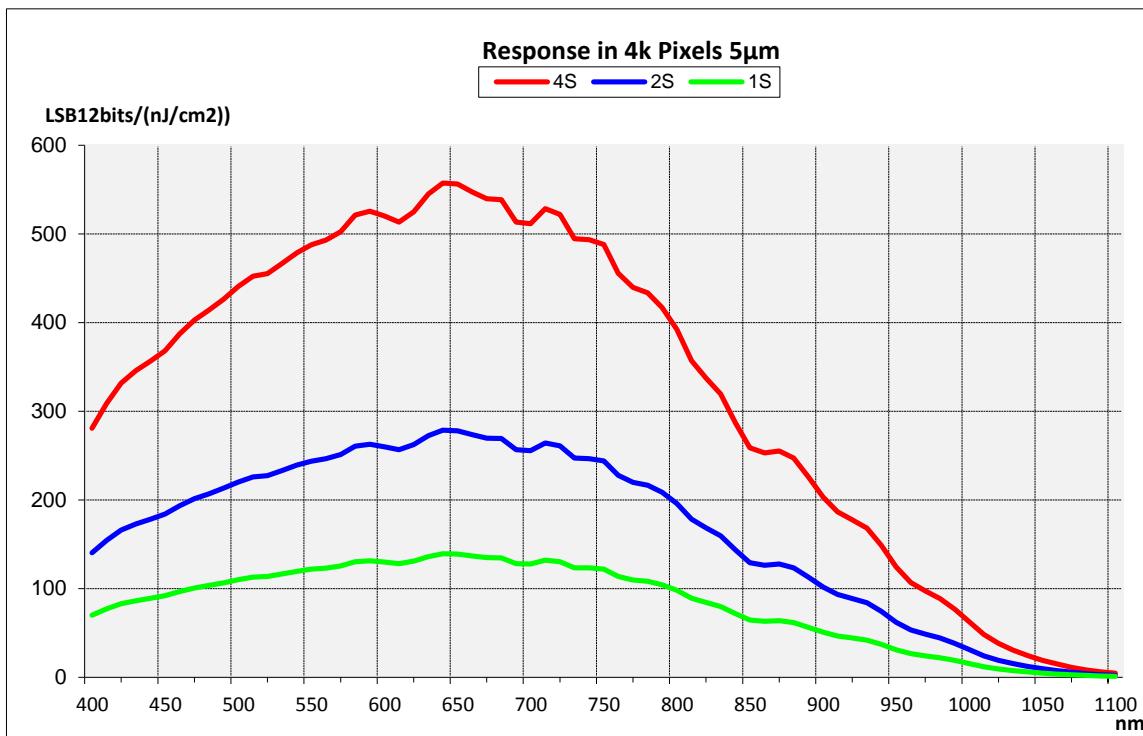

2.4 Response & QE curves

2.4.1 Quantum Efficiency

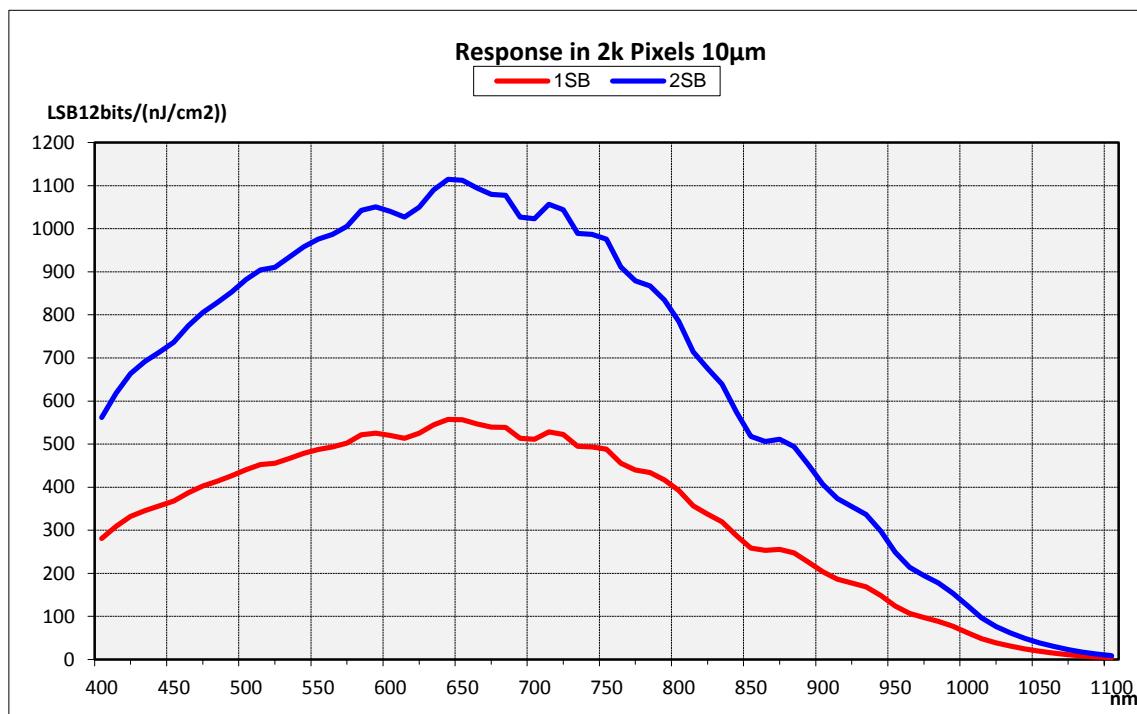

2.4.2 Spectral Responses

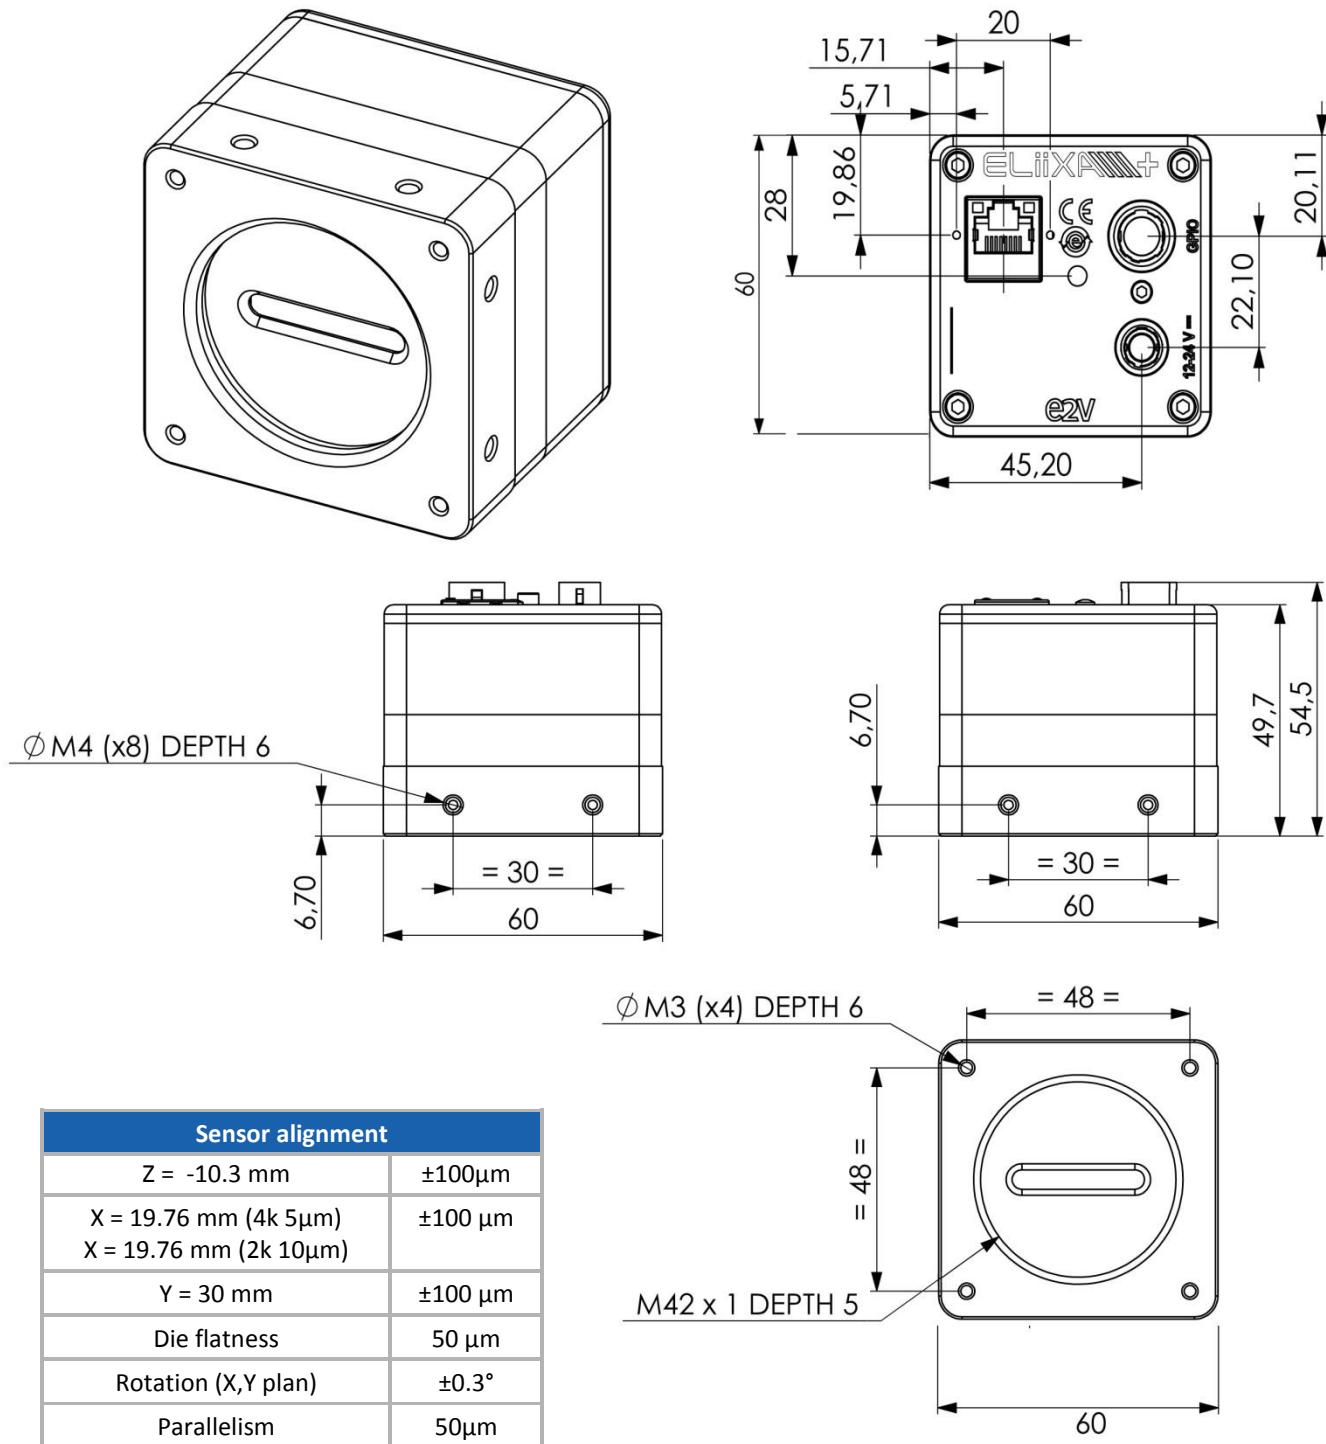

Single Modes : 1S, 2S, 4S

Binning Modes : 1SB, 2SB

3 Camera Hardware Interface

3.1 Input/output Connectors and LED

3.2 Power Connector

Camera connector type: Hirose HR10A-7R-6PB (male)

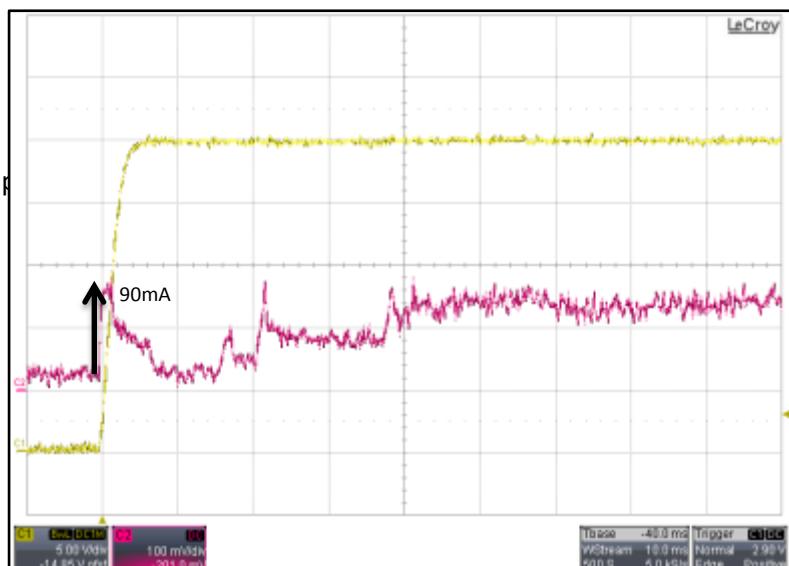

Cable connector type: Hirose HR10A-7P-6S (female)

	Signal	Pin	Signal	Pin
1	PWR	1	GND	4
2	PWR	2	GND	5
3	PWR	3	GND	6

Power supply from 12 to 24V
Power 11W max with an almost no inrush current peak

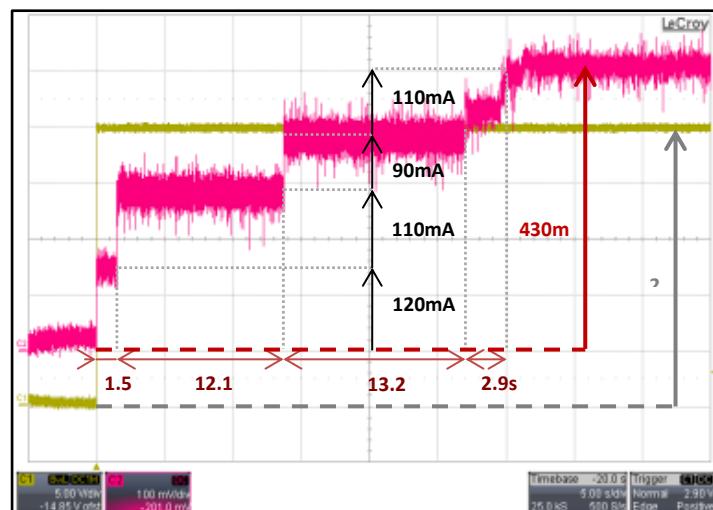

Camera side description

First 90ms after Power Up : The maximum

The complete Boot sequence :

- No real peak of Inrush current
- Several steps up to the nominal current (about 430mA under 24V)

If the NIC Board (on PC Side) is not forced at 5Gb/s (no Auto-Negotiation or 10Gb/s) then a peak of 1,5A can be observed at the boot on the camera power Supply. The 10Gb/s connection is required only if you want achieve the real 5Gb/s (50kHz in 4k) otherwise you can force the connection at 5Gb/s : This could prevent the camera to complete a safe boot (depending on the Power provided)

3.2.1 Status LED Behaviour

After less than 2 seconds of power establishment, the LED first lights up in WHITE. Then after a Maximum of 40 seconds, the LED must turn in a following colour :

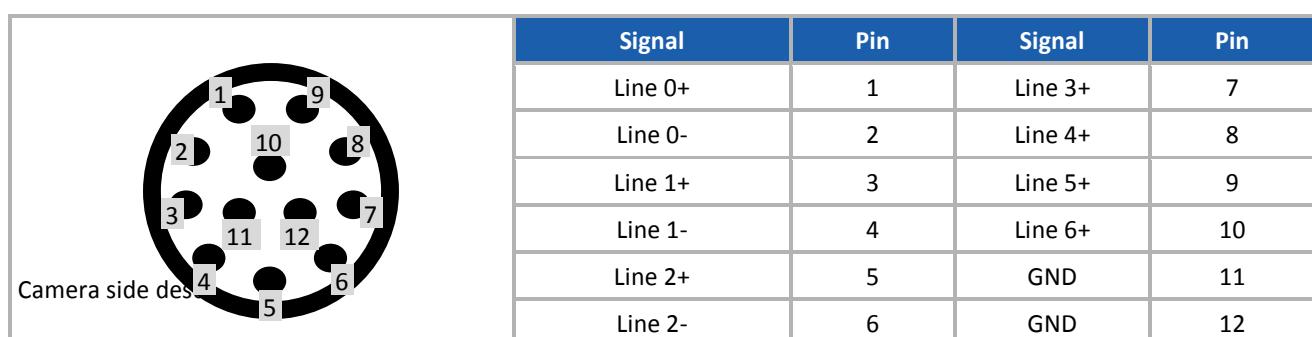

Colour and state	Meaning
Green and continuous	OK
Green and blinking slowly	Waiting for Ext Trig (Trig1 and/or Trig2)
Red and continuous	Camera out of order : Internal firmware error
Blue and continuous	Recovery (Upgrade mode) or Start boot sequence

3.3 GPIO Connector

Camera Connector type: Hirose HR10A-10R-12SB

Cable Connector type: Hirose HR10A-10R-12P

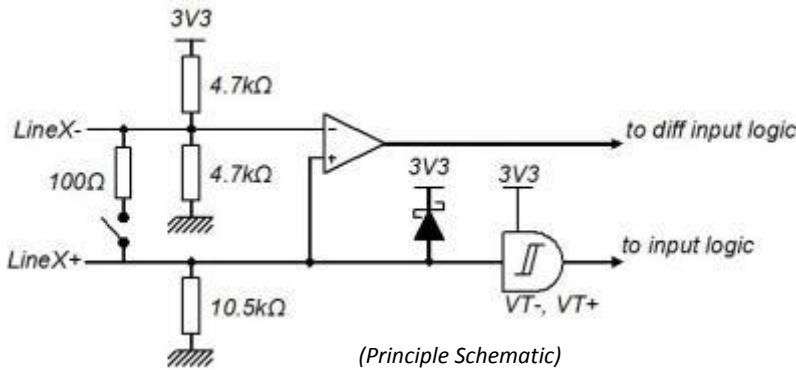

Cable type: cable immune from interference and with twisted pairs

Lines 0, 1 and 2

The GPIO Connector allows the following connections :

- **Line 0, 1 or 2** : Dedicated inputs for Line Triggers and Frame Trigger. Differential (RS422 with or without termination) or TTL (Single End) in 3.3V, 5V, 12V or 24V.

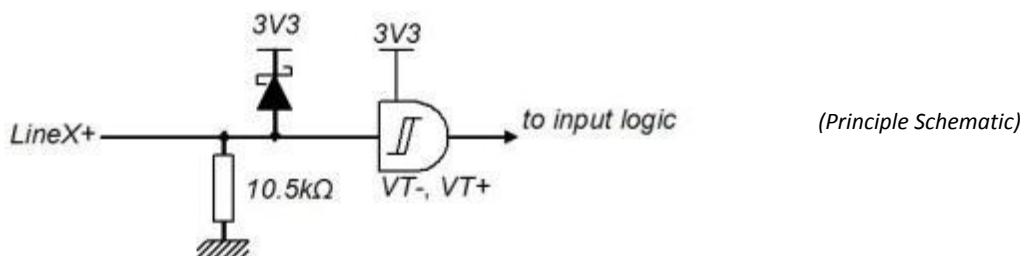

Input Thresholds	VT-Min	VT+Max	Unit
24V	5.5	10.7	V
12V	2.1	5.5	V
3.3 / 5V	0.5	2	V

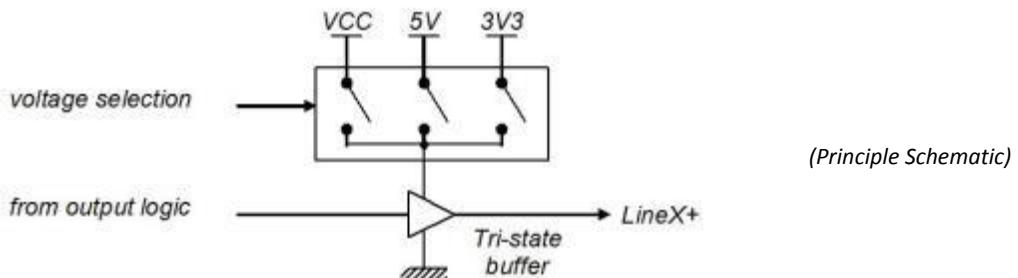

Lines 3, 4, 5 and 6

- **Line 3, 4, 5 and 6** : Configurable Inputs or Outputs in TTL only :
 - Input Configuration : Single End in 3.3V, 5V, 12V or 24V
 - Output configuration : Single End or Open Collector in 3.3V, 5V, or Camera power Supply

INPUT Configuration

OUTPUT Configuration

Output Lines have a limited current of 100mA : You have to make sure that each output is connected on sufficient resistance (depending on the output voltage) to avoid an over current which could damage the output circuit.

4 STANDARD CONFORMITY

The ELIIXA+ cameras have been tested using the following equipment:

- A shielded power supply cable
- A GigE cat 5E data transfer cable ref.

e2v recommends using the same configuration to ensure the compliance with the following standards.

4.1 CE Conformity

The ELIIXA+ cameras comply with the requirements of the EMC (European) directive 2004/108/EC (EN50081-2, EN 61000-6-2).

4.2 FCC Conformity

The ELIIXA+ cameras further comply with Part 15 of the FCC rules, which states that: Operation is subject to the following two conditions:

- This device may not cause harmful interference (EN55032), and
- This device must accept any interference received, including interference that may cause undesired operation (EN55024)

This equipment has been tested and found to comply with the limits for Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Warning: Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

4.3 RoHs Conformity

ELIIXA+ cameras comply with the requirements of the RoHS directive 2011/65/EU.

5 Camera Interface : NBASE-T™

5.1 What is the NBASE-T™ Technology ?

NBASE-T™ technology defines a new type of Ethernet signaling that boosts the speed of installed based twisted-pair cabling well beyond the cable's designed limit of 1 Gigabit per second (Gbps) for distances up to 100 meters.

Capable of reaching 2.5 and 5 Gbps using the large installed base of Cat5e and Cat6 cabling, NBASE-T™ solutions enable users to accelerate their networks in the most cost-effective, least disruptive manner.

Flexible silicon solutions can auto-negotiate the optimal network speed, be it the new NBASE-T™ rates, slower 2.5 Gbps and 5 Gbps rates and even 10Gbps for very high speed networks.

To introduce these new cameras, e2v has partnered with PLEORA Technologies, the world's leading supplier of high-performance video interfaces, the first company from the machine vision industry to join the NBASE-T™ Alliance, a consortium collaborating on new technologies that extend the bandwidth capabilities of twisted-pair copper cabling using standard Ethernet technology.

Then all NBASE-T™ ELIIXA+ are licensed for Pleora eBus SDK and PureGeV Software that you can download on Pleora website (<http://www.pleora.com/our-products/ebus-sdk>)

The ELIIXA+ NBASE-T™ Camera is not compliant with a standard 1 Gbps NIC Board : You need a 5/10Gbps Board (as the N-420 PCIe that can be delivered in option).

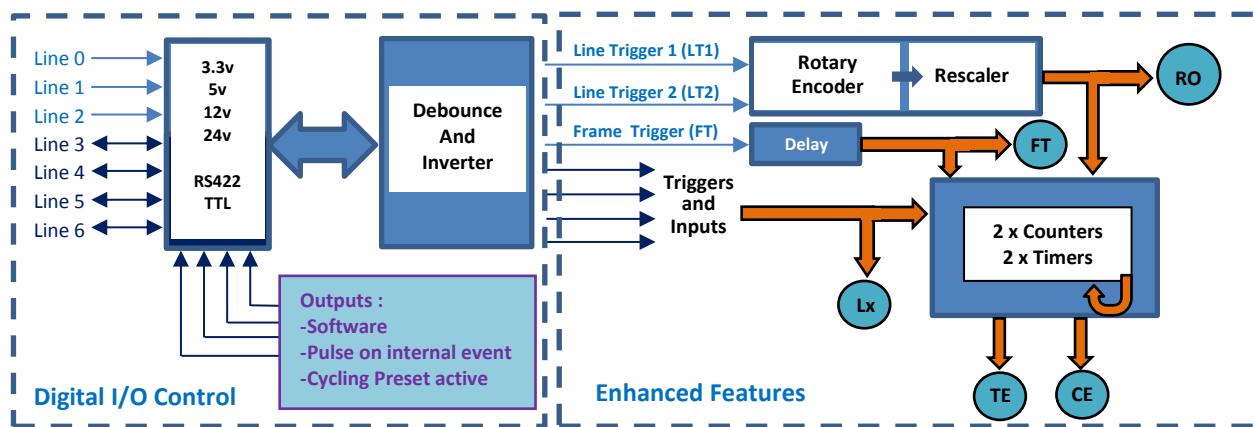

The following recommendations have to be taken in account for the configuration of the Board in order to achieve optimal performances :

- If you don't need to reach the Highest speed (5Gbps), you can fix the Board speed connection to 5Gbps (instead of Auto-Negociation) : This will avoid a significant peak of current of 1.5A at the Power Up.
- To reach the maximum throughput (5 Gbps which is equivalent to 50kHz in 4k pixels):
 - Update NIC driver (at least 4.4.405.152)
 - NIC board configuration:
 - > 10Gb/s connection
 - > Packet Size at 8192
 - > Enable Jumbo packet
 - > Number of RX Descriptors : 1000 (maximum)
 - > Number of TX Descriptor : 1000 (maximum)

6 Camera Interface Overview

6.1 Inputs, Outputs and Enhanced Features

- The Digital I/O Module allows the connection of 7 external Lines :
 - 3 dedicated inputs (Line 0, 1 and 2) that can generate 2 Line Triggers (LT1 and LT2) and one Frame Trigger (FT) that will be used as inputs in the Enhanced features Block.
 - 4 convertible generic Inputs / Outputs (Line 3, 4, 5 and 6) that can generate up to 4 additional Input Lines (L3, 4, 5 and 6) that will be used also in the Enhanced features Block or Used as Outputs.
 - A flexible in/Out block in RS422 or TTL with different detection levels (3.3v, 5v, 12v, 24v)
 - A Debounce and Inverter block that can filter and invert the internal Signals Inputs once affected to LT1, LT2, FT, L3, L4, L5 or L6.
- The Enhanced Feature block completes the treatment on internal signals to generate Triggers :
 - A delay dedicated to the Frame Trigger only (FT)
 - A Full Rotary Encoder management (Quadratic with or without reverse miscount) that use by default LT1 and LT2 as A/B Inputs. It can be bypassed to output by default LT1 as single Line Trigger input.
 - A Rescaler following the Rotary Encoder module (available also if Rotary Encoder is bypassed)
 - 2x Counters and 2x Timers

- The Internal Signals provided by the Digital I/O Block and the Enhanced Feature block are :
 - LT1/2 : Line Trigger 1/2
 - RO : Rotary Encoder Output
 - FT : Frame Trigger (Signal Issued from the DigitalIOPControl Block)
 - Frame Valid (Signal issued from the Frame Valid GenICam Trigger)
 - Frame Start (Signal issued from the Frame Start GenICam Trigger)
 - FLO (Exposure Active in the Sensor)
 - Lx : Line Inputs (L3, L4, L5, L6)
 - TE1/2 : Timers End 1/2
 - CE1/2 : Counters End 1/2
- Then these Signals will be used to generate the 4 possible GenICam Triggers :
 - Line Start : With Exposure mode Off or Timed and a possible Delay before Exposure.
 - Exposure Active : With Exposure mode in TriggerWidth, linked to the Trigger signal level
 - Frame Start : The Frame Length is fixed and set by “Height” parameter.
 - Frame Active : For a variable Frame Length which depends on the Frame Trigger
- Some other Interesting Features :

- A cycling mode which allows looping over a sequence of up to 8 Steps the 4 Possible Presets of Parameters (Gain, Exposure Time and Delay, FFC, LUT ...)
- Up to 4x Region of Interests with separate FFC can be selected for Output
- Additional Metadata at the end of each Line : Current Exposure Time, Missed Trigger, Current Preset, TimeStamp, Line Counter, Timers and Counters values ...

7 Camera Commands

7.1 Device Control

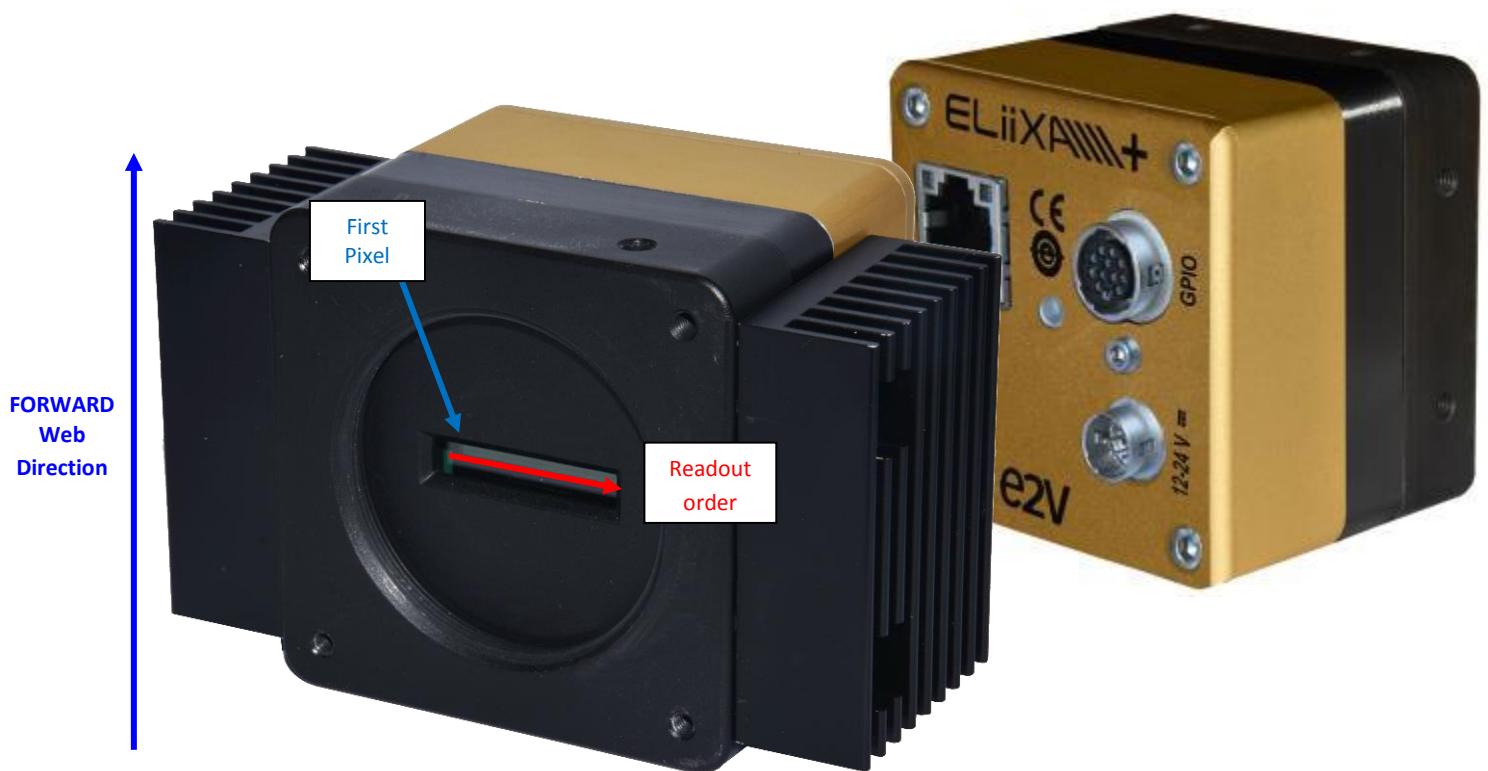

GenCP address	GenICam Register	Size (Bytes)	R/W	Description
0x11030	DeviceScanType	4	RO	AreaScan (0) or LineScan (1)
0x0048	DeviceVendorName	32	RO	e2v
0x0068	DeviceModelName	32	RO	NBASE_T_MONO
0x00A8	DeviceManufacturerInfo	48	RO	Camera Part Number : EV71C4MNTXXXX-BA0
0x0088	DeviceVersion	32	RO	Camera Firmware Version
0x00D8	DeviceSerialNumber	16	RO	Camera Serial Number : YYWWAXXXX
0x00E8	DeviceUserID	16	RW	Camera ID set by the User
0x11088	DeviceSFNCVersionMajor	4	RO	2
0x1108C	DeviceSFNCVersionMinor	4	RO	0
0x11090	DeviceSFNCVersionSubMinor	4	RO	0
-	DeviceTLVersionMajor	4	RO	2 (mapped on GevVersionMajor)
-	DeviceTLVersionMinor	4	RO	0 (mapped on GevVersionMinor)
-	DeviceLinkSelector	4	RO	1
	DeviceLinkSpeed	4	RO	625000000
-	DeviceLinkHeartbeatTimeout	4	RW	(5s by default)
	DeviceLinkCommandTimeout	4	RW	(1s by default)
0x0904	DeviceStreamChannelCount	4	RO	1
	DeviceStreamChannelType	4	RO	Transmitter (0), Receiver (1)
	DeviceStreamChannelEndianness	4	RW	Big (0), Little (1)
	DeviceStreamChannelPacketSize	4	RW	-
0x0900	DeviceEventChannelCount	4	RO	1
	DeviceCharacterSet	4	RO	ASCII(0), UFT8(1)
	DeviceRegistersEndianness	4	RO	Big(0), Little(1)
0x4E058098	CameraTemperature	4	RO	Read temperature value of the Device Format : Q10.2 in degree Celsius (-511/512)
0x4E058078	ElectronicBoardID	32	RO	Production info
0x4E05809C	ElectronicBoardTestStatus	32	RO	Production info
0x4E058114	Reboot	4	WO	Command : Set to 1 to reboot the Camera
-	TimeStampReset	4	WO	Command to Reset the TimeStamp
-	TimestampLatch	4	WO	Command to latch the TimeStamp with Custom Value
-	TimestampLatchValue	32	RW	Value to latch the TimeStamp on Command
0x4E062618	ManufacturerIndex	8	RO	Index of production set in Factory
0x4E058110	Status	4	RO	Camera Status : Bit0 to 7 : Reserved Bit8 : Overflow occurs during FFC calibration Bit9 : Underflow occurs during FFC calibration Bit10 : Calibration Error Bit11 : Scan Direction (Forward : 0, Reverse : 1) Bit12 : Reserved Bit14 : Initialization error Bit13 : Reserved Bit15 : Hardware error detected during init
0x4E060644	MissedTriggerCount	4	RO	Missed Triggers Internal Counter

7.2 Image Format Control

This section includes all the settings relative to the Image Format and size.

7.2.1 Image Format

- **Height** : Set the Height of the Image, but also the Buffer's Heights in the Application. From 1 to 16383
- **Test Image Selector** : Test Patterns are defined in Appendix A
- **Reverse Reading** : Reverse output the line in the "X" Direction.
- **Sensor Mode** : Depends on the camera version : 4k or 2k (Read Only)
- **Scan Direction** : Defines the if the Standard web direction is forward or Reverse versus the Mounting of the camera in the System. If Set on External, it is defined by the **Scan Direction Source** Signal (0:Forward, 1:Reverse) :

The Scan direction information is available and useful only for the 2S, 4S Modes (in 4K) or 2SB in 2k.

7.2.2 Meta Data

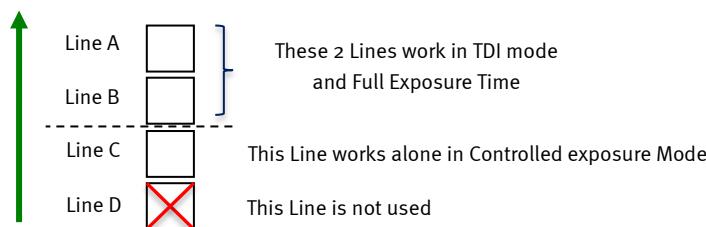

When enabled, Meta Data are added at the End of Each Line for a total of 24 Bytes (or 24 Pixels 8bits) In the table below :

M0/M1/M2... are the 8bits components of each Pixel

Pixel n°	Component	Data	Name	Details
1	M0	[7:0]	Exposure Time	Value on 2 Bytes. Multiple of 100ns from 0 to 6553,5µs
	M1	[15:8]		Missed Trigger
	M2	[23:16]	Current Cycling Preset	Bit2 (D18) set to 1. Reset by Register
2	M3	[31:24]	Line Counter Value	Bit(1:0) : Value of the cycling Preset in Use
	M4	[39:32]		Line Number (Counter). Reset by register.
	M5	[47:40]		Integer value on 4 Bytes : 0 to $2^{32}-1$
3	M6	[55:48]	Counter 1 Value	16 LSB of the Counter 1 Value
	M7	[63:56]		16 LSB of the Counter 2 Value
	M8	[71:64]		16 LSB of the Timer 1 Value
4	M9	[79:72]	Counter 2 Value	16 LSB of the Timer 2 Value
	M10	[87:80]		Universal Time counter in milliseconds.
	M11	[95:88]		Reset by Register. Value from 0 to $2^{64}-1$
5	M12	[103:96]	TimeStamp Value	16 LSB of the Timer 1 Value
	M13	[111:104]		16 LSB of the Timer 2 Value
	M14	[119:112]		Universal Time counter in milliseconds.
6	M15	[127:120]	TimeStamp Value	Reset by Register. Value from 0 to $2^{64}-1$
	M16	[135:128]		16 LSB of the Timer 1 Value
	M17	[143:136]		16 LSB of the Timer 2 Value
7	M18	[154:144]	TimeStamp Value	Universal Time counter in milliseconds.
	M19	[159:152]		Reset by Register. Value from 0 to $2^{64}-1$
	M20	[167:160]		16 LSB of the Timer 1 Value
8	M21	[175:168]	TimeStamp Value	16 LSB of the Timer 2 Value
	M22	[183:176]		Universal Time counter in milliseconds.
	M23	[191:184]		Reset by Register. Value from 0 to $2^{64}-1$

7.2.3 HDR mode

The High Dynamic Range Mode is using the top and bottom couple of lines of the sensor in a different way in order to get 2 different exposures that can be combined to give a High Dynamic range result :

There are three different possible outputs when the HDR mode is set :

- Single Line Bottom only : Line "C" only is outputted to check the High Levels
- Single Line Top only : Line "A+B" is outputted to check the Low Levels
- Single Line HDR : The Camera outputs the HDR Line reconstructed from "A+B" and "C" Lines in the camera in the "HDR" bloc.

The Exposition of the "C" Line is automatically controlled by setting the HDR Ratio :

- Ratio 1 : Equivalent to x2 ratio between Top and Bottom or 1 bit in the Dynamic
- Ratio 2 : Equivalent to x4 ratio between Top and Bottom or 2 bit in the Dynamic
- Ratio 4 : Equivalent to x8 ratio between Top and Bottom or 3 bit in the Dynamic
- Ratio 8 : Equivalent to x16 ratio between Top and Bottom or 4 bit in the Dynamic

How to Set the HDR Mode

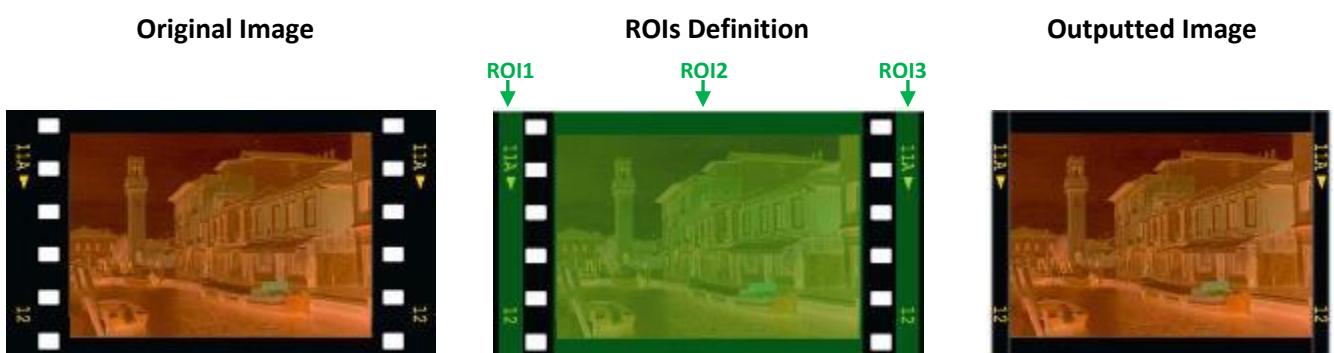

- ⇒ Set The Sensor Mode in "HDR"
- ⇒ Set The HDR Mode in "Single Line HDR" to Output an HDR Line
- ⇒ Select the Ratio of exposure required between the low and the high level Lines.
- ⇒ Set the Camera Synchronization Mode in Full Exposure Mode Preset : The choice of the exposure of the single Line is made in Automatic by selecting the Ratio between High and Low Level Lines.

More details are given in Appendix C

7.2.4 Regions of Interest

Up to 4 Regions of Interest can be set :

- No Overlap is possible between the different ROI : Start and width defined for each ROI.
 - Each ROI will perform its own Flat Field Correction (Max reference taken in the ROI).
- Example with 3 ROI on a "Film Scanning" Image :

GenCP address	GenICam Register	Size (Byte s)	R/W	Description
0x12500	SensorWidth	4	RO	Active Pixels number of the Sensor
0x12500	Width	4	RO	Total Pixels number outputted including MetaData
0x12510	Height	4	RW	Set the Height of the image (1 to 16383)
0x12540	PixelFormat	4	RO	Mono8, Mono10, Mono10Packed, Mono12, Mono12Packed
-	PixelSize	4	RO	Bpp8, Bpp10, Bpp12
-	PixelColorFilter	4	RO	None(0)
0x4E058074	TestImageSelector	4	RW	<ul style="list-style-type: none"> 0 : "Off" (Sensor image) 1: "GreyHorizontalRamp" 2 : "whitePattern" 3 : "GrayPattern" 4 : "BlackPattern" 5 : "GreyVerticalRampMoving"
0x4E058118	ReverseReading	4	RW	<ul style="list-style-type: none"> 0 : disable 1 : enable

-	GevGVCPExtendedStatusCodesSelector	4	RW	Version 1_1	
-	GevGVCPExtendedStatusCodes	4	RW	Enables the generation of extended status codes : o: False 1 : On	
-	GevGVCPPendingAck	4	RW	Enables the generation of PENDING_ACK : o: False 1 : True	
0x0960	GevGVSPExtendedIDMode	4	RW	Enables the extended IDs mode : o: Off 1 : True	
0x0A00	GevCCP	4	RW	Controls the device access privilege of an application : o: Open Access 1 : Exclusive Access 2: Control Access	
0x0A04	GevPrimaryApplicationSocket	4	RO	UDP source port of the primary application	
0x0A14	GevPrimaryApplicationIPAddress	4	RO	Address of the primary application	
0x0B00	GevMCPHostPort	4	RW	Port to which the device must send messages	
0x0B10	GevMCDA	4	RW	Destination IP address for the message channel	
0x0B14	GevMCTT	4	RW	Transmission timeout value in milliseconds	
0x0B18	GevMCRC	4	RW	Number of retransmissions allowed when a message channel message times out	
0x0B1C	GevMCSP	4	RO	Indicates the source port for the message channel	
-	GevStreamChannelSelector		WO	Selects the stream channel to control	
0x0D24	GevSCCFGUnconditionalStreaming	4	RW	Forces the Stream even if the Channel is closed : o: False 1 : True	
0x0D24	GevSCCFGExtendedChunkData	4	RW	Enables cameras to use the extended chunk data payload type for this stream channel : o: False 1 : True	
0x0D00	GevSCPIInterfaceIndex	4	RW	Index of the logical link to use	

0x0D00	GevSCPHostPort	4	RW	Controls the port of the selected channel to which a GVSP transmitter must send data stream
0x0D04	GevSCPSFireTestPacket	4	RW	Sends a test packet 0: Off 1 : On
0x0D04	GevSCPSDoNotFragment	4	RW	Used by the application to prevent IP fragmentation of packets on the stream channel : 0: Off 1 : On
0x0D08	GevSCPD	4	RW	Delay (in GEV timestamp counter unit) to insert between each packet for this stream channel
0x0D18	GevSCDA	4	RW	Destination IP address of the selected stream channel to which a GVSP transmitter must send data stream
0x0D1C	GevSCSP	4	RO	Indicates the source port of the stream channel
0x19010	GevStreamThroughputLimit	4	RW	Limits the peak bit rate in Mbps to be streamed out on the selected stream channel.

7.4 Acquisition Control

7.4.1 GenICam Triggers

Four GenICam Triggers can be configured :

- Line Start Trigger : Start the Line on an Edge variation of the Source
- Exposure Active Trigger : Exposure active on a certain Level of the Source
- Frame Start Trigger : Start the Frame on an Edge variation of the Source
- Frame Active Trigger : Frame active on a certain Level of the Source

Each Trigger has these 5 following parameters :

- Trigger Mode : Activates the Trigger. Only one Line and Frame Trigger activated in the same time.
- Trigger Source : Defines the Signal which is the Source of the Trigger (see table below)
- Trigger activation : Defines how the Source activate the Trigger (on edge for Line Start and Frame Start or level for Exposure Active and Frame Active)
- TriggerMaskSource : Defines the signal that can be set to enable/disable the Trigger
- TriggerMaskActivation : Defines on which level the TriggerMaskSource is activated.

All the following External / Internal Signals are used for the Trigger Sources or Masks :

Signal	Value	Trigger Sources				Trigger Masks			
		Line Start	Exp. Active	Frame Start	Fr. Active	Line Start	Exp. Active	Frame Start	Fr. Active

7.4.2 Cycling Preset modes and configuration

The Cycling Preset mode is the possibility for the camera to switch at least for each line between 4x sets of pre-defined parameters including :

- Exposure Time and Exposure Delay
- Flat Field Correction
- Gain (Amplification Gain)
- LUT

The Cycling Preset mode configuration allows up to 8 different steps for switching between this choice of 4 sets of parameters and thus with the arising of different possible events (Line Input, Line Trigger, Frame Trigger, end of Counter and/or Timer ...) :

If the Cycling mode is disabled or the number of configuration used (CyclingPresetCount) set to 1 or if the number of Repeater (CyclingPresetRepeaterNumber) is set to 1, then all these configuration are equivalent to the use of one single Preset which is the default one : **Preset 1**.

GenCP address	GenICam Register	Size (Bytes)	R/W	Description
0x4E0581DC	CyclingPresetMode	4	RW	Activation of the Cycling Preset Mode : 0: Off 1: On
-	CyclingPresetSelector	4	RW	Selects the Cycling Preset to save the automatic FFC Calibrations : 1: Preset 1 2 : Preset 2 4: Preset 3 8 : Preset 4 15: All Presets

7.4.3 Full Exposure Control Mode

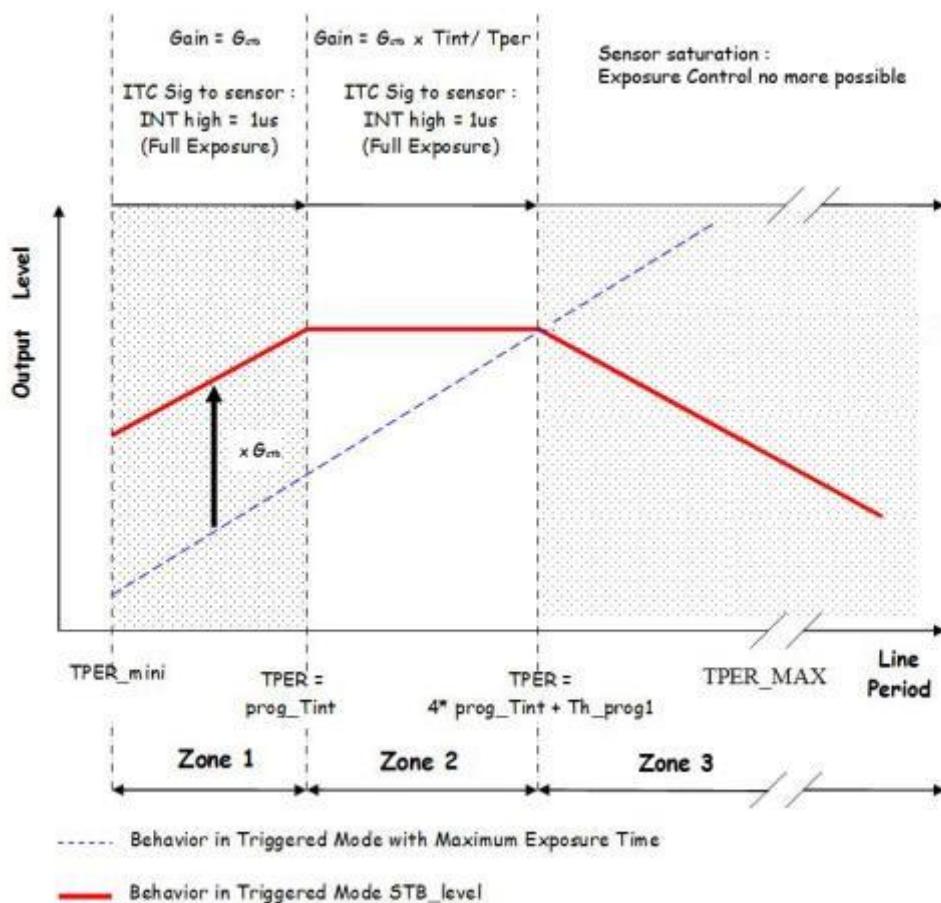

The Full Exposure Control

In Full Definition Enhanced Sensor Mode, the Sensor is working as a double TDI (Time Integration Delay) : The two Top Pixels and the two bottom Pixels are working together in TDI with a delay between their exposure and outputting by the same Memory node and ADC. The summation of the pixels is done in the “charge domain” before the Digital Conversion.

This is the case for the ELIIXA+ 4k in 4S Mode only

In TDI, control of the exposure is not possible: Only the full Exposure during the Line Period is possible. In order to allow the User to control the exposure in this Sensor mode (Synchronization Modes 1 and 3, described in the Acquisition control chapter), The ELIIXA+ Camera implement a “Full Exposure Control Mode” :

When the User selects a synchronization mode which requires the control of the exposure, the camera enters a specific mode:

The Line Period (measured) is **Tper**, its minimum value is **TPer_{mini}** (7.2μs on this camera) and the exposure time set by the User is **Prog_Tint**.

Zone 1 : If Tper < Prog_Tint

Not relevant. **Prog_Tint** has to be smaller than **Tper**. The Camera can't be used in that area

Zone 2 : If Tper < 4 x Max (TPer_{mini}, Prog_Tint) + 10μs

The Sensor works in Full Exposure during the whole Line Period (LP) and the gain applied on the output is variable (max x 4), set by User = **G_{stb}**

The Output is multiplied by the following Gain = **G_{stb} x Prog_Tint / Tper**

Zone 3 : If Tper >= 4 x Max (TPer_{mini}, Prog_Tint) + 10µs

The risk is the sensor saturates then the calculation above is no more valid : after showing an incorrect white balance, the image level will decrease down to 0 as the Line Period is increasing.
=> **The Camera can't be use in that area**

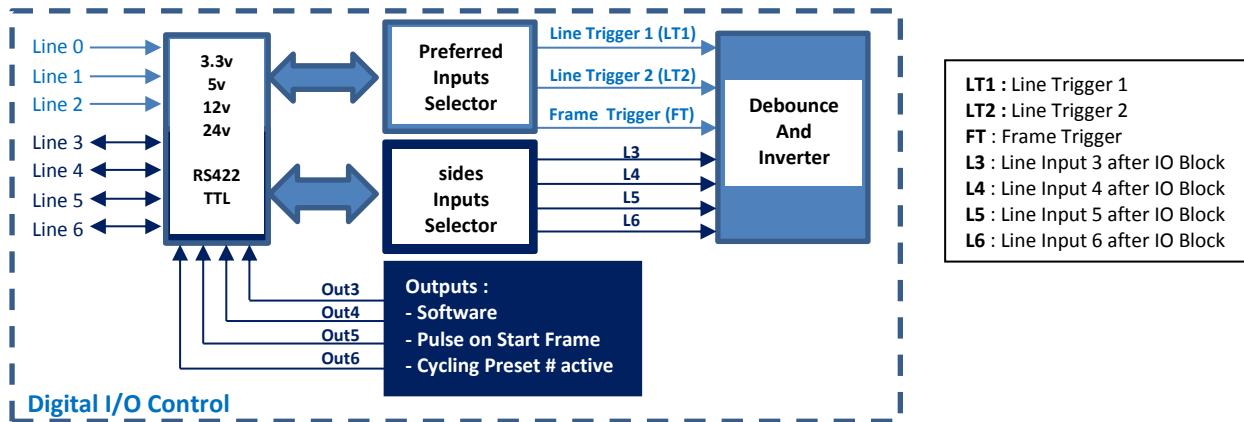

Gain for the “Full Exposure Control Mode” (See “Gain & Offset” Section below : *StabilizedGain*)

G_{stb} : The User Can set this Gain with a value up to x4 (Gain Section). The value recommended is the one which allows to cover the variation of the line period : 10% of variation requires a Gain at least of x1.2 (+/- 10%).
By default this value is set at x4.

7.5 Digital I/O Control

This Digital I/O Module allows to setup and transformed the 7 I/O Lines of the I/O Connector in useful internal signals :

- Line 0, 1 and 2 are preferred inputs (only inputs) to set the three internal Signals : Line Trigger 1 and 2 (LT1, LT2) and Frame Trigger (FT)
- Line 3, 4, 5 and 6 can be configured in additional inputs (for the generation of L3, L4, L5 and L6 internal Signals) as well as in dedicated Outputs

GenCP address	GenICam Register	Size (Byte s)	R/W	Description

7.6 Enhanced Features Control

7.6.1 Rotary Encoder, Rescaler and Frame Delay

The Embedded Rotary Encoder is managed by the two inputs Lines :

- LT1 taken as "A" quadrature input
- LT2 taken as "B" quadrature input

The Encoder takes in account the Forward/Reverse indication given to the camera (by software or external input) to determine the forward or Reverse position of the A and B quadrature inputs. Its "Forward/Reverse" outputs is just an indication of its working mode as soon as it is not disabled but has no action on the camera scanning direction.

The Output of the Rotary Encoder enters a Rescaler (Multiplier / Divider) that can be also bypassed (neutral).

The Rotary encoder has two working modes :

- Quadratic without miscount : The Encoder is sending only forward lines. Any reverse line is not sent and not counted.
- Quadratic with miscount : The Encoder is sending only forward lines but reverse lines are miscount in an internal counter. The Encoder will restart sending Line triggers as soon as each reverse Line miscounted has been recounted forward.

The Rotary Encoder can be bypassed. Then the "B" input is disabled and the Line Trigger 1 (LT1) connected on input "A" is passing through the Rotary encoder to enter the Rescaler

The Rotary encoder can't be used by changing the camera operation (Forward/Reverse) "on the fly" as some sensor modes require some reset and some time to change the scanning direction.

Counter Description

The Counter counts the Event Source Edges.

The counter Duration is set and when the counted value reaches the duration, the Output of the counter rises to 1. If the reset input of the counter is not set (Off), the counter resets immediately : The end count value is set in the “Value at Reset”, the output is reset and Counter restarts counting on the same event.

The Reset input can be set on an external source and also can maintain the reset of the counter (on level)

As soon as the Reset input is set but not active, the counter counts. If it

reaches the duration before any reset, the output rises to 1 and the counter carries on counting. Then if the Reset arises, the “Value at Reset” is set with the current value (even higher than the duration), the output is set to 0 and the counter can restart counting on the same even as soon as the reset input switches down to 0.

If the Reset arises before the counter has reached the duration, the “Value at Reset” is set with the current value (even lower than the duration), the output is set to 0 and the counter can restart counting on the same even as soon as the reset input switches down to 0.

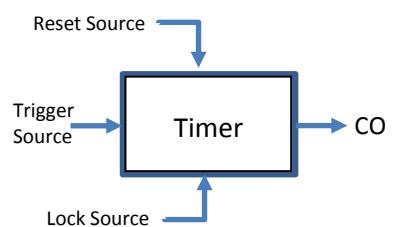

The Counter can also be locked by an external source : As soon as the lock input is active, the counter value doesn't increment on an Event Source edge but can be reset if the reset signal arises.

Timer Description

The Timer starts on its Trigger Source Edge

The Timer Duration is set and when this value is reached, the Timer output rises to 1. If the Reset source is not set (Off) then the Timer resets immediately : The output is reset and Timer restarts after the same event edge.

As soon as the Reset input is set but not active, the timer Output remains to 1.

When the Reset arises, the output is set to 0 and the Timer can restart as soon as the reset input switches down to 0. If the reset arises before the end of the Timer duration, the Timer is reset without switching to 1 and can restart as soon as the reset input switches down to 0.

The Timer can also be locked by an external source : As soon as the lock input is active, the Timer stops at its current timing value and can be reset if the reset signal arises. The Timer restarts from its current timing position when the reset input is released.

7.7 Gain Control

This section includes only the two main gains which have a global action on the whole sensor line :

- The Pre-Amplification Gain (considered as the only Analog Gain as it takes place in the sensor during the ADC conversion) and which is detailed below. The value proposed are : x1, x2, x4, x8
- The Amplification Gain : Adjustment gain or fine digital gain up to 8dB to compensate between each value of the Pre-Amplification Gain. It is implemented as following : $(1 + \text{Gain}/4096)$ with “Gain” between 0 to 6193.

There are 4 of these gains available : One gain per Cycling Preset. This is the only global Gain that can be switched as quickly to be available the next line.

GenCP address	GenICam command	Size	R/W	Description
0x4E05803C	PreAmpGain	4	RW	Pre-amplifier gain to: 0 : x1 1 : x2 2 : x4 3 : x8
0x4E058028	GainAll_PR1	4	RW	Preset 1 (Cycling Mode) and default Digital gain from 0dB (0) to +8dB (6193) : (1 + <Val>)/4096
0x4E05802C	GainAll_PR2	4	RW	Preset 2 (Cycling Mode) Digital gain from 0dB (0) to +8dB (6193) : (1 + <Val>)/4096
0x4E058030	GainAll_PR3	4	RW	Preset 3 (Cycling Mode) Digital gain from 0dB (0) to +8dB (6193) : (1 + <Val>)/4096
0x4E058034	GainAll_PR4	4	RW	Preset 4 (Cycling Mode) Digital gain from 0dB (0) to +8dB (6193) : (1 + <Val>)/4096
0x4E0585CC	StabilizedGain	4	RW	Full Exposure Control Gain when sensor mode is set to 4S Mode with Integration Time Controlled : <val>: from 0 (x1) to 49152 (x4) (1+val/16384)
0x4E062604	DigitalAll Gain	4	RW	Digital Gain (Contrast Expansion). Disabled when LUT is enabled. from 0dB (0) to + dB (255) (TBD)
0x4E062608	BlackLevelAll	4	RW	Digital Offset (Contrast Expansion). Disabled when LUT is enabled. from -4096 to 4095 step 1

The Gain x8 has to be used with precaution : An FFC User Calibration could be required when using this level of Gain.

7.8 Flat Field Correction Control

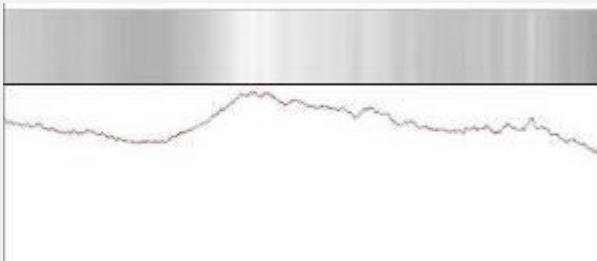

How is performed the Flat Field Correction ?

What is the Flat Field correction (FFC) ?

The Flat Field Correction is a digital correction on each pixel which allows :

- To correct the Pixel PRNU (Pixel Response Non Uniformity) and DSNU (Dark Signal Non Uniformity)
- To Correct the shading due to the lens
- To correct the Light source non uniformity

Before

After

How is calculated / Applied the FFC ?

The FFC is a digital correction on the pixel level for both Gain and Offset.

Each Pixel is corrected with :

- An Offset on 10 bits (Signed Int S9.1). They cover a dynamic of ± 256 LSB in 12bits with a resolution of 1/2 LSB 12bits. Offet : the MSB is the sign, the rest of 9bits is from 0 .. 256 with precision of 1/2
- A Gain on 12 bits (Unsigned Int U2.12) with a max gain value of $x5^{(*)}$

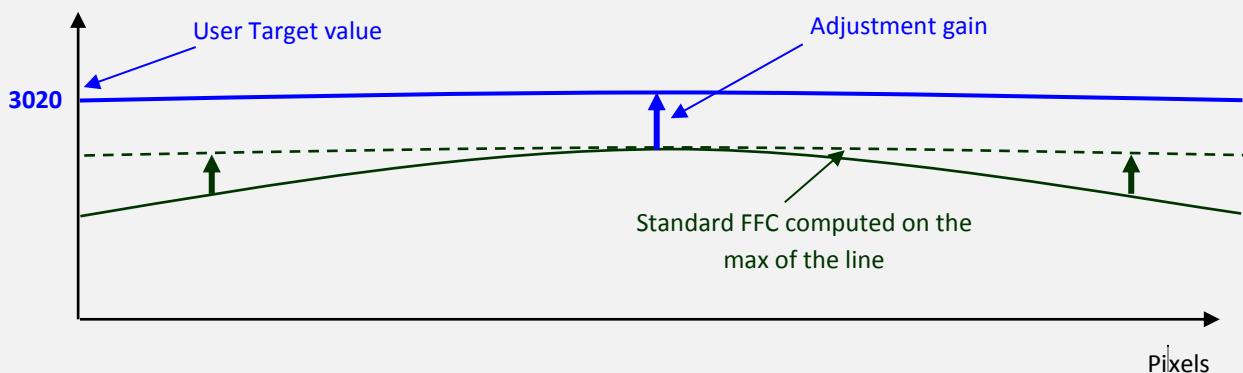

The calculation of the new pixel value is : $P' = (P + Off).(1 + Gain/1024^{(*)})$. Gain : 0 to 4095

The FFC processing can be completed with an automatic adjustment to a global target.

This function is designed as "**FFC Adjust**". This adjustment to a User target is done by an internal hidden gain which is re-calculated each time the FFC is processed while the FFC adjust function is enabled.

The FFC is always processed with the max pixel value of the line as reference. If enabled, the FFC adjust module (located at the output of the FFC module) calculates the adjustment gain to reach the target defined by the User.

When the FFC result is saved in memory, the adjust gain and target are saved in the same time in order to associate this gain value with the FFC result.

How to perform the Flat Field Correction ?

Don't forget first to setup the Cycling Preset Selector (Acquisition Control / Cycling Preset) in order to select in which Preset (1, 2, 3, 4 or All) you'll save the result of your FFC once calculated.
 If the Cycling Preset Mode is not activated, by default it will be saved in Preset 1.

FPN/DSNU Calibration

- > Cover the lens
- > Launch the FPN Calibration : Grab and calculation is performed in few seconds

PRNU Calibration

The User must propose a white/grey uniform target to the Camera;

The Gain/Light conditions must give a non-saturated image in any Line.

The Camera must be set in the final conditions of Light/ Gain and in the final position in the System.

If required, set a user target for the FFC adjust and enable it.

- > White uniform (moving) target. Use The FFC Low Band Filter if the Target can't move.
 This will remove the defects of the target itself
- > Launch the FFC
- > Enable the FFC
- > You can save the FFC result (both FPN+PRNU in the same time) in one of the 4 x FFC User Banks.
- > The user target and Gain are saved with the associated FFC in the same memory.
- > Remove the FFC Low Band filter (set to 0) if used during the Process.

Advices

The ELIIXA+ Cameras have 4 x FFC Banks to save 4 x different FFC calibrations. You can use this feature if your system needs some different conditions of lightning and/or Gain because of the inspection of different objects : You can perform one FFC to be associated with one condition of Gain/setting of the Camera (4 Max) and recall one of the four global settings (Camera Configuration + FFC + Line Quarters Balance) when required.

If you intend to use several settings of Light, then several FFC, you need to enable the cycling Preset Mode and save your FFC, no more in the different Banks but in the 4x different Presets available and thus can be done in the same User Bank.

Some Warnings can be issued from the PRNU/FPN Calibration Process as "pixel Overflow" or "Pixel Underflow" because some pixels have been detected as too high or too low in the source image to be corrected efficiently.

The Calculation result will be proposed anyway as it's just a warning message.

The Status Register is the changed and displayed in Device Info section :

Register status is detailed chap §7.1.

7.8.1 PRNU Low Frequency Filter for FFC

The FFC Low Band Filter allows an easier make in use of the FFC (PRNU Part) : You can use a non-moving paper and you can filter the defects of these paper before the FFC calculation in order to not take them in account. The command "LowFilterWidth" sets the intervals (+/-) around each pixel for the average calculation. Each pixel is then compared to the average on the interval around it and replaced by this average if the difference is too high. With a filter value set at "X", the calculation interval will be [-X , +X] around the pixel position.

A large interval value allows filtering big defects on the paper but finally the setting of this interval depends also on the magnification in the system.

The FFC Low band filter is just an help to make in use the FFC (PRNU part) more easily : This can be done with a non-moving white paper as its defaults will be filtered in order to not being taken in account in the PRNU Correction.
Don't forget to reset the filter (to "0") after usage.

GenCP address	GenICam command	Size	R/W	Description

7.9 Look Up Table

The User can define an upload a LUT in the Camera that can be used at the end of the processing.

The LUT is defined as a correspondence between each of the 4096 gray levels (in 12 bits) with another outputted value. For example, a “negative” or “reverse” LUT is the following equivalence :

Real value	Output value
0	4095
1	4094
2	4093
...	

Then the size of each value is 12bits but the exchanges with the Application/PC are done on 16 bits :

For 4096 gray levels (from 0 to 4095) the total file size for a LUT is 8Ko.

If this LUT is enables, the digital Gain and Offset will be disabled

If this LUT is enables, the digital Gain and Offset will be disabled

There are x4 LUT that can be saved for each Preset : The LUT is one part of the parameters that can be switch while using the Cycling Preset Feature

The LUTPresetSelector is used to select the LUT Preset which will be chosen to be read, written or Reset Saving or restoring the LUT from/To the bank is always done with the x4 Preset together.

Then there is only one User Bank to save the LUT which includes x4 Presets.

GenCP address	GenICam Command	Size	R/W	Description
0x4E0585D0	LUTEnable	4	RW	Enables the usage of the LUT : This will bypass Digital Gain and Offset
0x4E05A5EC	LUTRestore	4	RW	Restore the LUT from the bank for all x4 Presets
0x4E05A5E8	LUTSave	4	RW	Save the LUT to the bank for all x4 Presets
0x4E05A5D4	LUTReset	4	RW	Reset LUT selected by LUTPresetSelector to Neutral LUT
0x4E05A5D8	LUTIndex	4	RW	Set index of LUT for reading or writing LUT
0x4E05A5DC	LUTValue	4	RW	Set/Get LUT Value at LUTIndex position to preset LUTPresetSelector
0x4E0585D4	LUTValueALL	8192	RW	LUT Area (4096 values x 2 bytes selected by preset LUTPresetSelector)
-	LUTPresetSelector	-	-	LUT Preset to reset read or write 1: Preset1 2: Preset2 4: Preset3 8: Preset4 15 : All preset

7.10 Device Access Control

Set the Privilege access of the Camera (only Integrator ⇔ User)

GenCP address	GenICam Command	Size	R/W	Description
0x4E0580BC	CameraPrivilegeLevel	4	RO	Display the current Privilege Level : 0 : Factory Mode 1 : Integrator Mode 2 : User Mode
0x4E0580C0	ChangePrivilegeLevel	4	RW	Set the Privilege Level : 1 : Set back Factory => Integrator 2 : Set back Integrator => User Setting back User => Integrator requires a code (ask to support)

7.11 Save and Restore

The Camera Parameters are divided in 3 different categories to be saved in Memory :

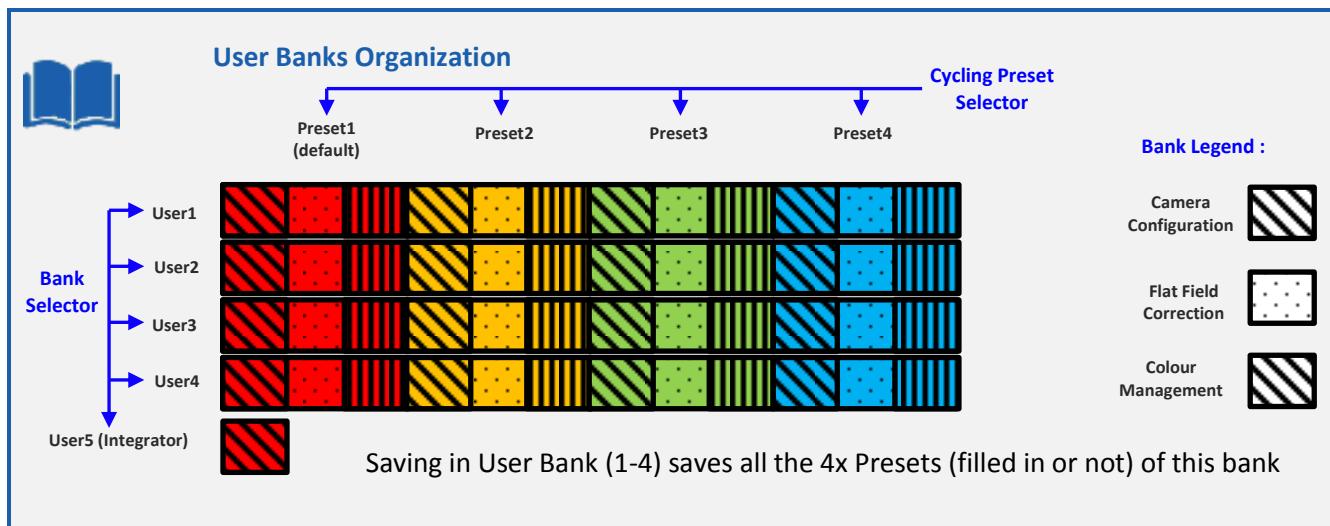

- **Flat Field Correction** : All the results of FFC Calibration (DSNU + PRNU). FFC Enable or FFC Filter width are saved in Camera Configuration bank (below)
- **LUT** : Look Up Tables
- **Camera Configuration** : All the other parameters including Image Format, Acquisition, GPIO, ... and enable switches for FFC, White Balance and Colour Correction Matrix.

There are 4 User Banks for each category (5 for Camera Configuration with the Integrator Bank) and One Factory (Default) Bank (Bank 0)

Each Bank of each category includes the differentiated parameters of the 4 x Presets for the Cycling Mode : Saving in one User bank implies to save Common parameters as well as all the 4 Presets in the same time.

Then for the differentiated parameters, there are 16 different possibilities (4 (User Bank) x 4 (Preset)) :

- Exposure Time
- Exposure Delay
- Amplification Gain
- FFC (DSNU & PRNU)
- LUT

APPENDIX

Appendix A. Pattern Tests

A.1 Test Pattern 1: Vertical wave

The Test pattern 1 is a vertical moving wave : each new line will increment of 1 grey level in regards with the previous one : level reaches 255 before switching down to 0

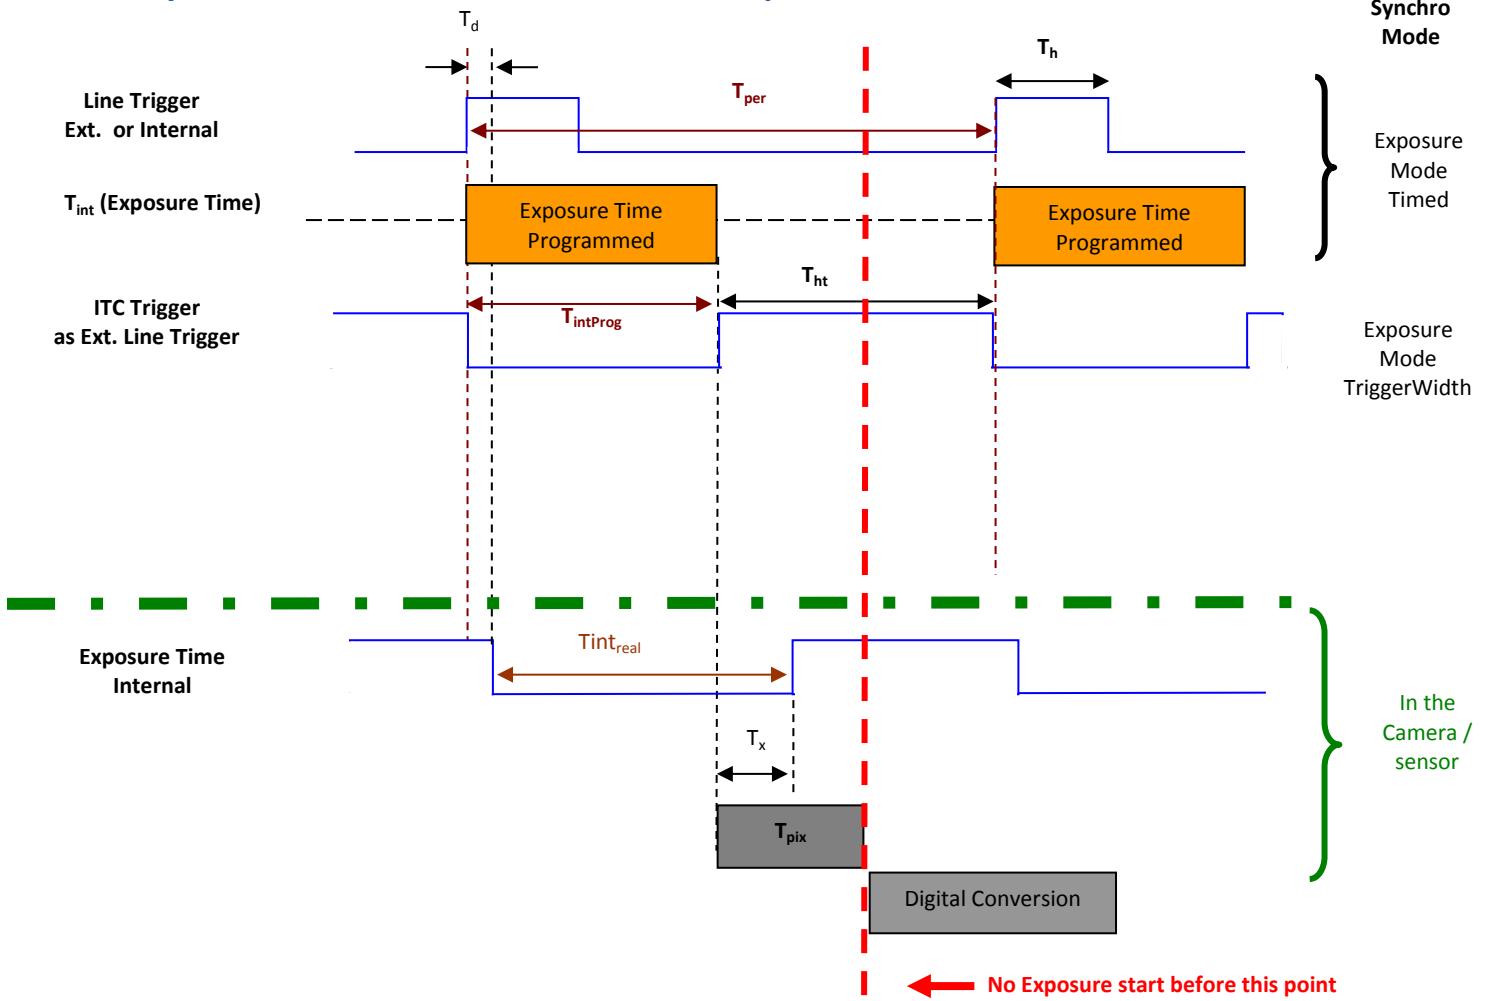

A.2 Test Pattern 2: Fixed Horizontal Ramps

Starting at 0, an increment of 1 LSB is made every 16 pixels. When it reaches 255, turns back to 0 and starts again.

Appendix B. Timing Diagrams

B.1 Synchronization modes with variable Exposure Time

T_{pix} : Timing Pixel. During this uncompressible period, the pixel and its black reference are read out to the Digital converter. During the first half of this timing pixel (read out of the black reference), we can consider that the exposure is still active.

Digital Conversion : During the conversion, the analog Gain is applied by the gradient of the counting ramp (see next chapter : Gain & Offset). The conversion time depends is **6µs** (in 8bits per color/Pixel)

This conversion is done in masked time, eventually during the next exposure period.

T_d : Delay between the Start exposure required and the real start of the exposure.

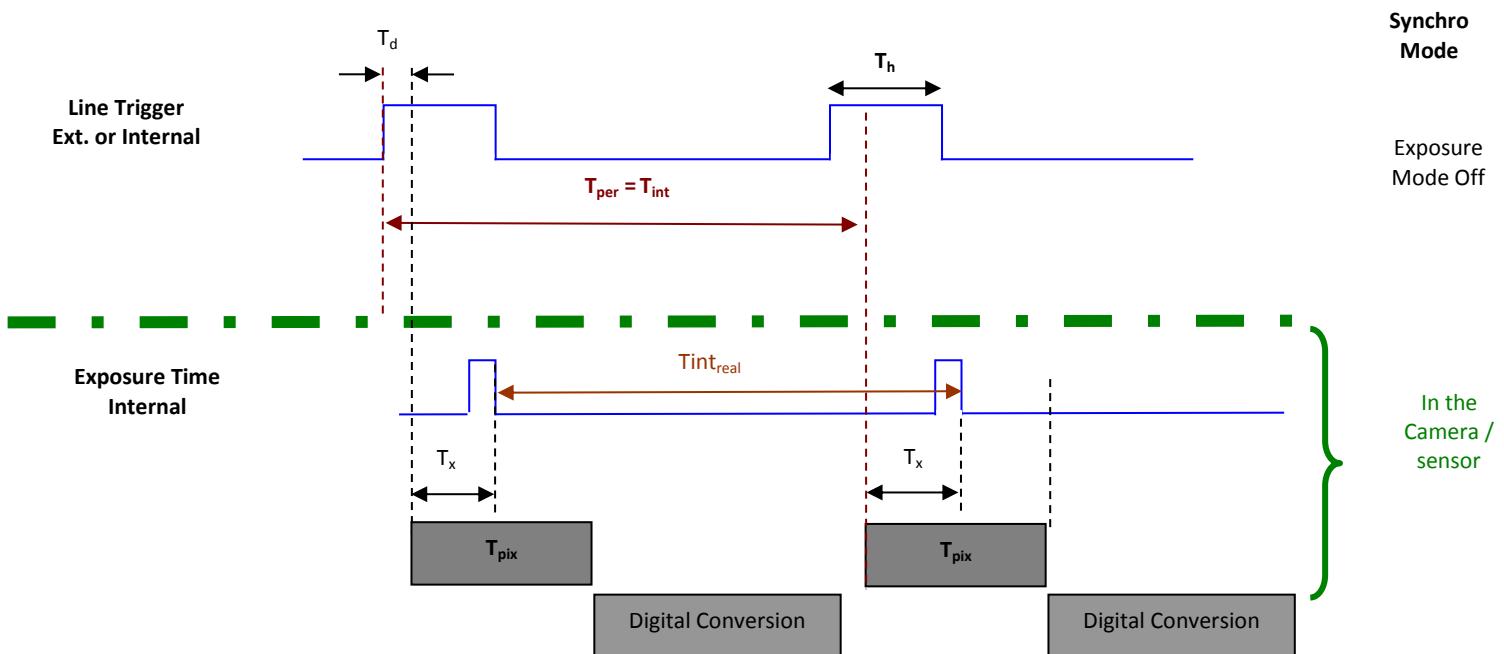

If T_{per} is the Line Period (internal or external coming from the Trigger line), in order to respect this line Period, the Exposure Time as to be set by respecting : $T_{int} + T_{pix} \leq T_{per}$

Then, the real exposure time is : $T_{intreal} = T_{int} + T_x - T_d$

In the same way, The high level period of the Trig signal in sync=3 mode, $T_{ht} \geq T_{pix}$

For a Line Period of $LinePer$, the maximum exposure time possible without reduction of line rate is : $T_{intmax} = T_{per} - T_{pix}$ (T_{pix} is defined above) but the effective Exposure Time will be about $T_{intreal} = T_{int} + T_x - T_d$

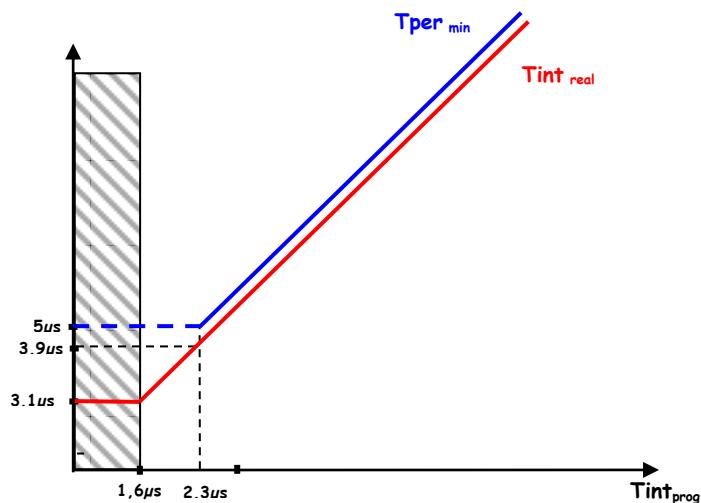

B.2 Synchronization modes with Fixed Exposure Time

In these modes, the rising edge of the Trigger (internal or External) starts the readout process (T_{pix}) of the previous integration. The Real exposure time (T_{int_real}) is finally equal to the Line Period (T_{per}) even if it's delayed from ($T_x + T_d$) from the rising edge of the incoming Line Trigger.

B.3 Timing Values

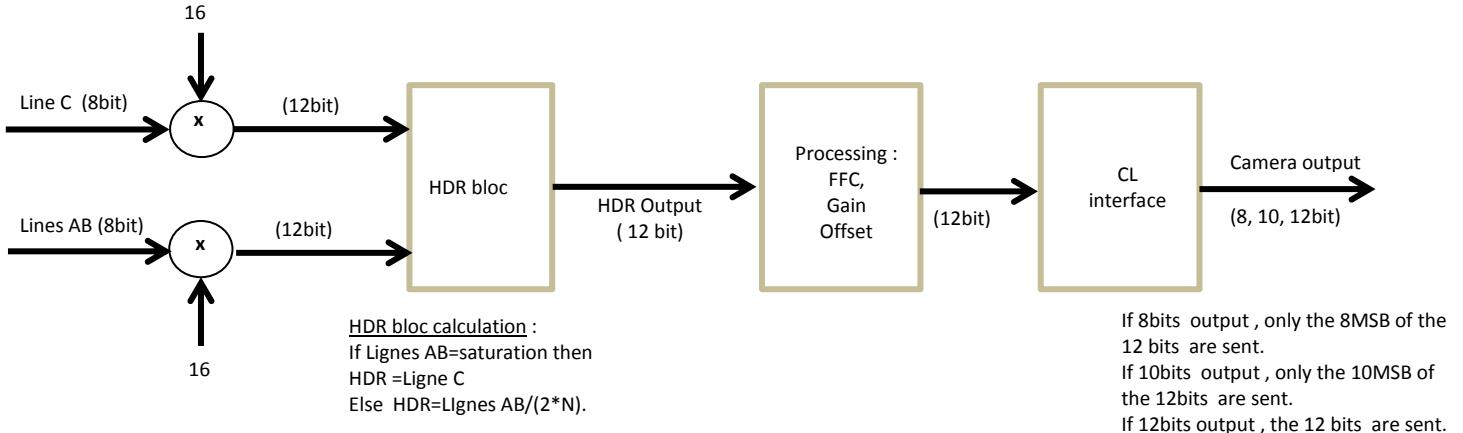

Label	Min	Unit
T_{pix}	2.7	μs
T_x	1.62	μs
T_h	0,120	μs
T_{ht}	T_{pix}	μsec
T_d	0.7	μs

Appendix C. HDR Mode

C.1 HDR Block

With the HDR Single Line Mode, the “HDR” is calculated in the camera as following :

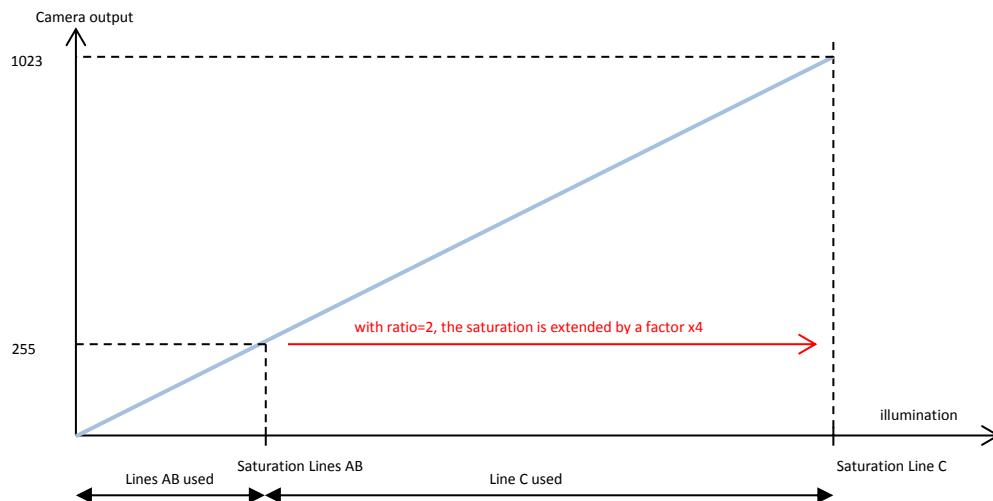

HDR bloc calculation :

If the double Line “AB” is saturating, the information is taken from the single line “C” (Low levels)

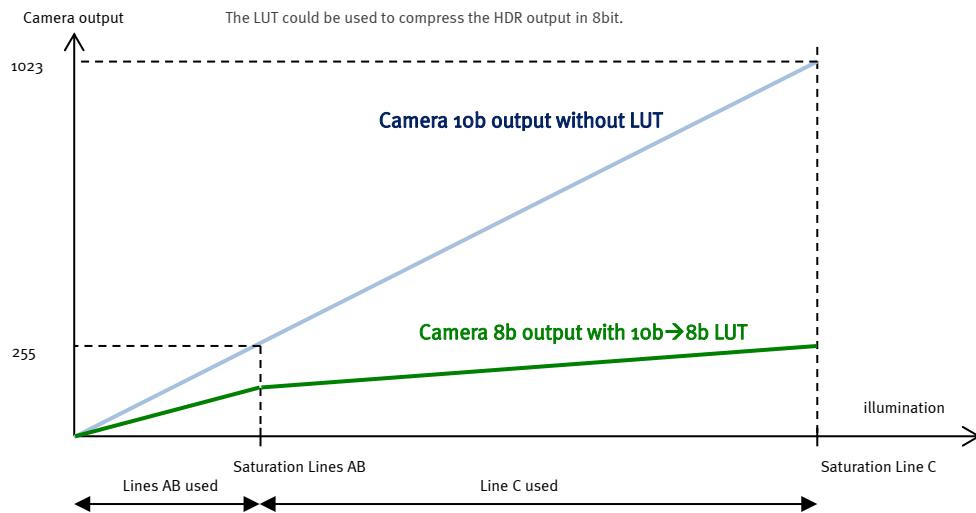

If the double Line “AB” is non saturating, the value taken is issued from these line but divided by 2^*N : N is the ratio set in automatic Exposure mode.

In this case, the maximum dynamic possible is 12 bits : The MSB are taken from the 8bits MSB of the Lines “AB” and divided by 16 max

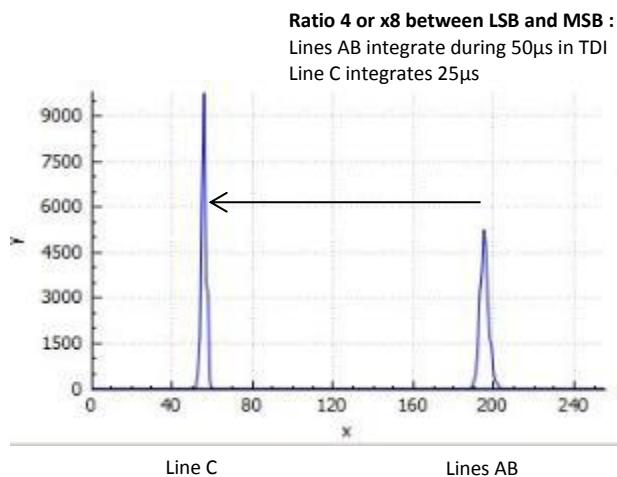

C.2 Example with Ratio 2 and 10bits output

C.3 HDR With LUT 10bits => 8bits

C.4 Example of difference between "AB" and "C" Line :

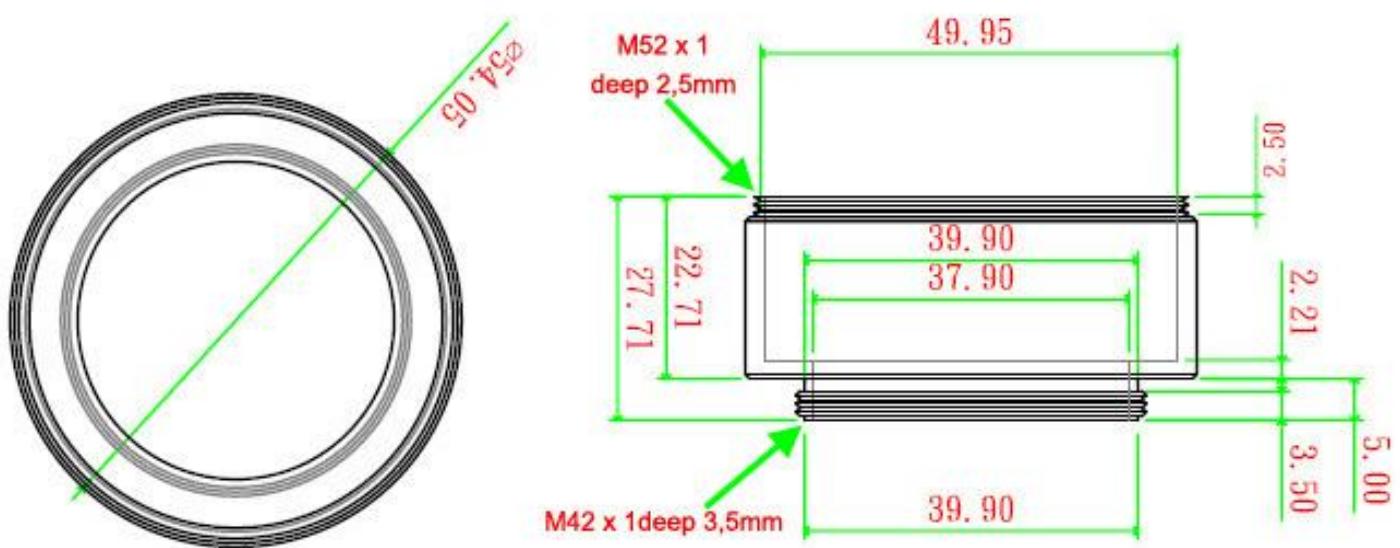

Appendix D. Accessories

D.1 F-Mount

F Mount: (Part number EV50-MOUNT-F)

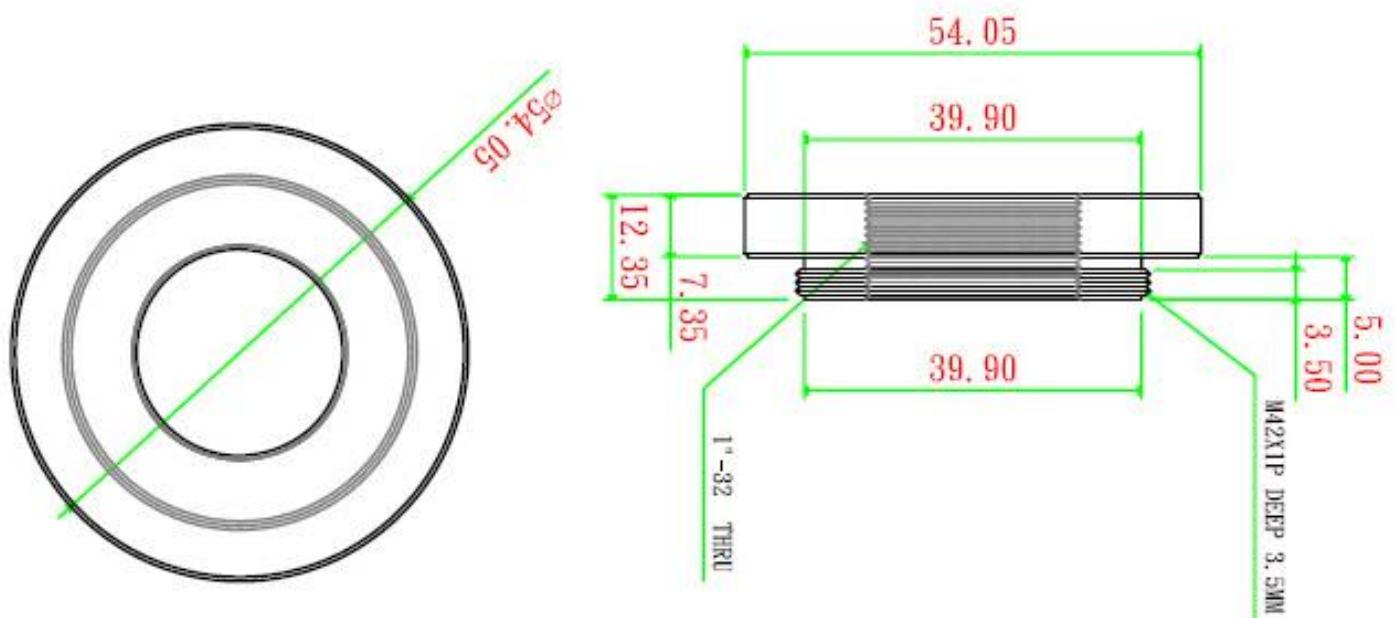

Drawing for the additional part (except Nikon BR3) :

D.2 C-Mount

C Mount : (Part number EV71-C-MOUNT)

D.3 Set of Heatsinks

The ELIIXA+ NBASE-T Cameras are already delivered with 2 Heat Sinks, but if necessary, additional heat sinks are available (set of 2) and they can be fixed on any side of the front face :

Set of 2 x Heat Sinks : Part number AT71KFPBVIVA-CAA

The Camera has been designed to dissipates the maximum of the internal heat through its front face : The packaging of the sensor is larger to increase the surface in contact with the front face and then improves the dissipation. The first part (black) of the rear housing is also important for the Heat dissipation as it's in contact with the FPGA and is used to dissipate its temperature.

In the system, the camera has to be fixed by its front face with the largest contact possible with a metallic part. Without any specific cooling system, a simple air flow around the camera will improve roughly the dissipation.

Appendix E. Network Connection

2x Kits including NBase-T Board and cables (power + Trigger) are available :

E.1 Single Network Board + Cables (GPIO + Power) Kit

This kit includes :

- One Single NBase-T (5/10GigE) board (N480)
- One set of 2 cables (GPIO + Power supply).

Part number : **EVOA0000-ONTCKA0-U**

Contact the Customer Service for more information

E.2 Dual Network Board + Cables (GPIO + Power) Kit

This kit includes :

- One Dual NBase-T (5/10GigE) board (N440)
- 2 sets of 2 cables (GPIO + Power supply).

Part number : **EVOA0000-ONTCKA1-U**

Contact the Customer Service for more information

E.3 Ethernet Cable

The Ethernet cable required is Cat5E at the minimum up to 50m. Cat 6 or even 6A is required for a connection up to 100m.

	2.5G Base-T	5G Base-T
Installed Cat 5e	✓	Extend. Freq.
Installed Cat 6	✓	✓
Installed Cat 6A	✓	✓

0 to 50m cable	Cat 5e	Cat 6	Cat 6A
2.5G Nbase-T			Assured
5G Base-T Assured			Assured

50 to 75m cable	Cat 5e	Cat 6	Cat 6A
2.5G Nbase-T			Assured
5G Base-T Assured			Assured

75 to 100m cable	Cat 5e	Cat 6	Cat 6A
2.5G Nbase-T			Assured
5G Base-T Assured			Assured

E.4 PureGev Application and eBus Package

The ELIIXA+ NBase-T Camera is licensed for the PEORA eBus Application/Driver and SDK Package : You can download it from the Pleora Website : www.pleora.com

E.5 Driver Configuration and Inter-Operability

The Pleora Driver is recommended for highest performances.

The Camera can also be connected to the following Software (tested) solutions :

- DALSA-Teledyne SAPERA
- Matrox MIL
- National Instruments IMAQ

Appendix F. Revision History

Manual Revision	Comments / Details	Firmware version	PureGev and eBus Package
Rev A	Preliminary release	1.0.0	5.x
Rev B	Updated Timing Pixel for iCMos2 Characterization values updated with Production Board Kits description in Appendix Change of RX Descriptor recommended value to 1000	1.0.4	5.x
